ENGLISH

1 INTRODUCTION

Note: This user's guide is adapted to software version v.5.108 of MDX 500 and v.1.88 of MDX 600.

The **MDX Series** is the first measurement device of the new advanced generation of Ankaro field strengh meters.

This new **MDX Series** has been designed with a very new concept in order to offer improved technical features, higher functionality, high precision on measurement procedures, improved on screen graphics (OSD), smaller and compact size and easiness for use it. All these features render the current meter an essential device for telecomunications installers and professional.

Some of the main features are hereafter explained:

- Measure of analog multistandard terrestrial (AMTV) and satellite signals (FMTV)
- Sync pulse for analog signals
- Measure of digital terrestrial (DVB-T), satellite (DVB-T) and cable (DVB-C) signals
- Analog and digital image representation on colour TFT screen
- Improved user interface
- Friendly On Screen Display (OSD)
- Simultaneous representation of measure, spectrum and image for the reference signal
- Datalogger
- TFT 5" Color Monitor
- Compact and light design (3,9 Kg)
- Improved connectivity (USB, input and output Audio/Video minijack,...)
- High battery life (till 4,5 hours without LNB)

With all the above features, the **MDX Series** field strengh meter will allow the user to analyze all television signals, solving every problem on a television, satellite or cable installation.

This is a common manual for the entire range of Field Strength Meters MDX Series. This manual is complete and it contains the information to make run the meter, although there are options which only can be used in some models.

In case that some chapter or section concerns only to some models and not to ALL models, this chapter will be marked as follows:

MDX 500	MDX 600
MDX 500	MDX 600

2 RECOMMENDATIONS FOR BEST USE OF MDX Series

The aim of this manual is to provide the fundamentals of the operation of the field strength meters in order to make the best of it.

The **MDX Series** field strength meter is a portable devices, conceived for exterior use, with certain limitations:

- It is not advisable to use the strength meter under the rain; although it is water proof, it could be damaged if the water penetrates inside.
- It is recommended not to use the meter in case of extreme weather conditions, such as temperatures below 0 degrees or over 40 degrees centigrade
- Never use your meter as a standing support
- The mains power supply is designed for indoor use, so it must not be used outdoor. Always use the power supply adapter provided with your meter.

Please keep always in mind the following recommendations:

- Please note that the meter's battery is specifically designed for the device. An eventual replacement by any other, could cause a failure of operation, or even worse, a serious damage to the battery and to the meter.
- A field strength meter is a very sophisticated measurement device, sensitive to sudden temperature and humidity changes, and affected by impacts and vibrations.
- Never open the meter by yourself. Every manipulation inside the device requires specific instruments. An unqualified manipulation may cause serious damage in the meter.
- Always handle the meter with care, it is a high technology device that may be damaged in case of improper use.
- Please do not obstruct the ventilation orifices situated on both sides of the meter, in order not to overheat the system.
- It is important not to use poor quality connectors, nor right angle connectors and different adapters, since all these elements degrade the quality of the signal arriving to the meter's RF-IN socket.

3 PACKAGE CONTENTS

Please check the contents of your package in the following list:

- Field Strength Meter
- Bag
- Mains power supply 20V 2,5Amp.
- Mains power cable for the power supply
- Adapter F-F female. Please note that this is a high quality adapter. Do not replace it by any other, since the frequency response is specific for this system.
- User's quick reference guide
- Document providing a list of the meter's components, as well as the information concerning - the meter's calibration.

Please do not throw away the original box, it is specially designed for protecting your meter. You might find it useful for transportation, or in case you wish to have it calibrated in the future.

4 TECHNICAL SPECIFICATIONS

MDX 500

RF Standards

FM: 88-108 MHz

Terrestre: B/G (CCIR),

- B/G DE, S band channels in Germany
- B/G IT, III band channels in Italy
- M (PAL)
- L/L' (France)
- I (UK)
- D/K/K' (O.I.R.T.)
- M/N (USA and Japan)
- BB_AU (Australia)
- D/K PAL

Satellite: C and Ku bands

Monitor

Type: 5" (14cm) TFT color

Color standards: PAL, SECAM and NTSC

Audio amplifier: 1W inside the speaker

Programs

Memories: 1000 programs could be saved inside the internal memory.

Data Logger: 4000 measures could be saved inside the internal memory. These saved values could be measures, spectrum and syncro pulse.

These values could be downloaded through USB port.

LNC power supply

Voltage: 0, 5V, 13V, 18V, 13V+22Khz and 18V+22Khz (shown by OSD).

Max current.: 450 mA short circuit protected

DiSEqC: 1.2

Auxiliary inputs / outputs

A/V: Minijack Audio/Vídeo input and output

RS-232: Serial port for PC connection

USB: Host Driver USB 2.0

Power Supply

Battery: Litio - Ion (90 W/hour)

Battery level ind.: Continuous control on OSD

Battery life: 4.5 h without LNB power supply

Charging time: Aprox. 5 hours for 100% (it depends on battery previous charge)

External: 20V / 2.5A

Mechanics

Dimensions: 280x130x220mm + bag

Weight: 3,9 Kg.

Frequency

Range: 5-862 MHz and 900-2150 MHz

Tuning: Continuous in full band

Steps: 50KHz (terrestrial band) and 500 KHz (satellite band)

Audio range on analog satellite: 4.5-9 MHz

Input

Impedance: 75 Ohms

Connector: "F" type (male) (+F-F female adaptor)

Protection: ±50 VDC, 130dBµV (3V RMS)

Attenuator: 0 - 60dB, AUTO range mode selectable

Spectrum

Bands: 5-47 MHz / 47-862 MHz / 900-2150 MHz

Display mode: Horizontal sweep and logaritmic amplitude

Marker: Unical

Span: Full, 500, 200, 100, 50, 20 or 10 MHz

Resolution filters: 2 MHz, 1MHz or 200 KHz

Analog signals: Level, Video/Audio level, C/N, sync pulse

Range: TV: 20 - 125 dBuV

SAT: 30 -125 dBuV

Units: dBuV, dBmV o dBm

Accuracy: ±1.5 dB @ 25ºC

Acustic signal: Audio frequency proportional to signal level

Digital

QPSK

Measurements: Power, BER before and after Viterbi, non recovered errors, C/N, MER, Noise Margin

Standard: DVB-S and DSS

COFDM

Measurements: Power, BER before and after Viterbi, non recovered errors, MER, C/N, Noise Margin

Modes FFT: 2K, 8K and AUTO

Guard intervals: 1/4, 1/8, 1/16, 1/32 and AUTO

Internal modulations: 64 QAM, 16QAM and QPSK

QAM

Measurement: Potencia, BER, non recovered errors, MER, Noise Margin

Modulation: 16, 32, 64, 128, 256 QAM

MPEG2 decoder

FTA (Free to Air) program list

It shows NIT, PID Audio-Video and PCR

MDX 600

RF Standards

Battery life: 4.5 h without LNB power supply
Charging time: Aprox. 5 hours for 100%
(it depends on battery previous charge)
External: 20V / 2.5A

Mechanics
Dimensions: 280x130x220mm + bag
Weight: 3,9 Kg.

Frequency
Range: 5-862 MHz and 863-2150MHz
Tuning: Continuous in full band
Steps: 50KHz (terrestrial band) and 500KHz (satellite band)
Audio range on analog satellite: 4.5-9 MHz

Input
Impedance: 75 Ohms
Connector: "F" type (male) (F-F female adaptor)
Protection: ±50 VDC, 130dBµV (3V RMS)
Attenuator: 0 - 60dB, AUTO range mode selectable

Spectrum
Bands: 5-862MHz and 863-2150MHz
Detection: Peak, Average and Maximums
Display mode: Horizontal sweep and logaritmic amplitude
Marker: Unical
Precission: ±1.5 dB @ 25ºC of environment temperature alter a heating of 30 minutes.
Span: Full, 500, 200, 100, 50, 20 or 10 MHz
Resolution fi lters: 2 MHz, 1MHz or 200 KHz

Analog signals
Level, Video/Audio level, C/N, sync pulse
Range: TV: 20 - 125 dBuV
SAT: 30 -125 dBuV
Units: dBuV, dBmV o dBm
Accuracy: ±1.5 dB @ 25ºC of environment temperature alter a heating of 30 minutes.
Acustic signal: Audio frequency proportional to signal level

Digital
DVB-S (QPSK)
Measurements: Channel Power, Noise Margin, C/N, BER before and after Viterbi, MER, Wrong Packets
Standards: DVB and DSS
Symbol Rate: up to 45Ms

DVB-S2 (QPSK and 8PSK)
Modes: QPSK and 8PSK
Measurements: Channel Power, Noise Margin, C/N, BER before and alter of the decoder LDPC/BCH, MER, Wrong Packets
Symbol Rate: up to 40Ms

DVB-T (COFDM)
Measurements: Channel Power, Noise Margin, C/N, BER before and alter Viterbi, MER, Wrong Packets
Mode FFT: 2K, 8K and AUTO
Guard Intervals: 1/4, 1/8, 1/16 y 1/32, AUTO
Internal Modulations: QPSK, 16QAM, 64QAM (AUTO)
Band Widths: 8, 7, 6MHz and AUTO
Offset: Automatically manager, up to ±500Khz.

DVB-H (COFDM)
Available for the operating channels at 2K and 8K, with the same criteria than DVB-T

DVB-C (QAM)
Measurements: Channel Power, Noise Margin, BER before Viterbi, MER, Wrong Packets
Symbol Rate: up to 7Ms
Constellations: 256, 128, 64, 32 and 16 QAM

Decoding MPEG2
Available to display FTA programs (Free to Air – free channels).
List of channels of the Digital Stream, indicating if they are Video, Radio, Data, SD/HD, free or scrambled.
Viewing of the NID and ONID.
Auto or manual selection of the PID of Video/Audio/PCR

5 METER'S POWER SUPPLY

The field strength meter may receive its power supply via its internal batteries or using the external power supply provided with the meter.

The **MDX Series** includes a Li-ion 90W/hour battery, with a charged life over 4,5 hours without LNC power suply.

In order to charge the battery, please connect the 20V 2,5A power adapter output to the meter after having checked that it is turned off. The LED indicating battery charge will blink during charge. At the end of the charge cycle the LED will stop blinking and will stay continuously ON.

Meter's battery could be charged with the devide switched on or switched off.

Important: it's highly recomended to charge the battery only when it has been completely used. Moreover, in order to have a 100% full charged battery, it could be necessary to charge it at least for 5 hours with the meter switched-off.

6 FRONT PANEL DESCRIPTION

The **MDX Series** front panel presents the following apparearence:

The front panel of the test equipment is made of 5 main parts:

1.- Monitor. It displays the OSD menu that allows to navigate through the differents options to display the spectrum, measurements, pictures, etc.

2.- Click rotary wheel. It allows to navigate easily through the options of the OSD menu, just turning to the left or right the wheel. It's also possible to confirm the selected option doing a click at the center of the wheel.

3.- Arrow keys. These four arrow keys have a similar function than the rotary wheel. They allow to navigate up and down through the OSD menu. Moreover the arrow keys allow to increase or decrease differents values as span, volume,... depending on the main mode currently selected.

4.- Main keypad. This keypad is composed of several keys with differents functions: on/off key, band key, meny keys,... Some of these keys made part of a numerical keypad that can be used to entry the frequency value, channel or program value.

5.- RF-IN connector. F male connector for antenna signal cable.

6.1 MAIN KEYPAD DESCRIPTION

fav

By default, to switch from an Analogue carrier to a Digital one. It can be configured with other functions.

With numeric entry active it is #1.
With alphabetic entry active, it is * / #

sound

Audio menu. The options are the following:

- Volume (Level 0-100%)
- Audio type (Audio/Buzzer): Selecting the type of audio in "Buzzer", the speaker will buzz relative to the level of the signal received. On the top status bar will appear the following icon.

If the Buzzer option is selected, the audio of the channel will be substitute by the buzz.

- Carrier frequency: (FM, 5.5, 6.5, v4.5-9)

With numeric entry active it is #2.
With alphabetic entry active, it is a b c

image

Picture menu. The options are the following:

- Brightness: 0-100 %
- Contrast: 0-100%
- Color: 0-100%
- Hue: 0-100%
- External Video: Off / On. It will allow enable/disable the input of the external video.

NOTE: Once selected the external video input, the meter only will leave activated the keys "Sound" and "Image", allowing only watching on TV Mode, and disabling the spectrum and measures mode.

- Video line: In analogue signals, you can overlap to the picture of the tuned channel, the oscillograme of one of the lines of the composed video. MDX 600

- Video line number: The line to be showed. MDX 600

With numeric entry active it is #3.
With alphabetic entry active, it is d e f

nav

Setup the navigation mode: by frequency, by channel (it is available only in terrestrial band), by program, by group or by SatCr (this one only in satellite band).

With numeric entry active it is #4.
With alphabetic entry active, it is g h i

setup

Setup meter menu. The options are the following:

1. System:
- Language
- Beep: key's beep
- Favorite key config
- System info
- Factory default
- Firmware upgrade
- Update Autoscan
- Sensibility

2. Power off modes:
- On/Off key: (stand by / switched off)
- Auto standby (battery): (Never/ 1min / 2min / 3min / 4min / 5 min / 10 min /15 min 30 min / 60 min)
- Auto power off (battery): (Never/ 1min / 2min / 3min / 4min / 5 min / 10 min /15 min 30 min / 60 min / 120 min)
- Auto standby (DC): (Never/ 1min / 2min / 3min / 4min / 5 min / 10 min /15 min 30 min / 60 min)
- Auto power off (DC): (Never/ 1min / 2min / 3min / 4min / 5 min / 10 min /15 min 30 min / 60 min / 120 min)

3. RF:
- Units: (dbuV, dBmV, dBm)
- Terrestrial standard: (B/G, B/G DE, B/G IT, L/L, M, NTSC, MPAL, D/K, I , BB_AU, D/K PAL)
- Cable standard (B/G, B/G DE, B/G IT, L/L, M, NTSC, MPAL, D/K, I , BB_AU, D/K PAL)
- Satellite local osc: (IF, C, KU, K9750, K10000, K10600, K10700, K10750, K11250, K11300, K11325)
- Cable band: (Active, hidden)
- Band navigation: (Linear, curl)
- Autoscan Standard: (All, Selected) For scanning all the standards or only the current one. When all the standards are being scanner, the first one scanner will be the current one.
- Level filter: (0.2 MHz, 1 MHz, 2MHz, Auto)

4. Backup: Function to restore the system:

1) Save all datas to USB: Function to make a security copy into a USB device.
2) Restore datas from USB: Function for restoring a copy of security from a USB device.

Depending on the type of file, there are different options to restore: All, Programs, Autoscan, Satellites or Data logger).

5. Clock: Time and date setup

With numeric entry active it is #5.
With alphabetic entry active, it is j k lz

programs

Programs menu. The options are the following:

- Create program
- Save program
- Rename program
- Delete program
- Load programs from USB
- Save programs to USB
- Group management

With numeric entry active it is #6.
With alphabetic entry active, it is m n o

band

Band selection:

- Terrestrial 47-862 MHz
- Satellite IF: 900-2150 MHz MDX 500
  863-2150 MHz MDX 600

With numeric entry active it is #7.
With alphabetic entry active, it is p q r s

tools

Tools menu:

- Datalogger
- Satellite finder
- Band scan
- DVB T
- TS recording MDX 600
- Transmodulator Programming

With numeric entry active it is #8.
With alphabetic entry active, it is t u v

supply

Power supply menu:

- RF IN voltage: (Off, 5V, 13 V, 18V)
- Tono 22 KHz: (Off, On, Auto)
- DiSEqC switch (Off, A, B, C, D)
- RF voltage on power up: (Off, On)
- Motor
- SatCR

With numeric entry active it is #9.
With alphabetic entry active, it is w x y z

autoscan

This function allows tuning the selected carrier automatically, it is, it carries out an auto scanning of the carrier. In case the carrier is not found, an error message will be displayed.

options

Signals setup options:

1. Carrier mode: (Analog, digital)

2. Digital modulation (it depends on selected band)

COFDM Setup:

1. Mode: (Auto, 8K, 2 K)
2. Spectrum inversion: (Auto, On, Off)
3. Guard interval: (Auto, ¼, 1/8, 1/16, 1/32)
4. Bandwidth: (Auto, 8 MHz, 7 MHz, 6MHz)
5. Priority: (Hihg, low)
6. Offset: (Auto, 0 ,+125,-125,+166,-166,+333, -333, +500, -500)

The default value for Span in Terrestrial is 50 MHz

QPSK Setup:

1. Symbol rate: (1000-50000)
2. Mode: (DVB, DSS)
3. Spectrum inversion: (Auto, On, Off)

The default value for Span in Satellite is 100 MHz

4. DVB: (DVBS1, DVBS2) MDX 600
5. Constellation Display: (Off, Full, 1, 2, 3, 4) MDX 600

QAM Setup:

1. Symbol rate: (870-7000)
2. Spectrum inversion: (Auto, On, Off)
3. Constellation: (256, 128, 64, 32, 16)
4. Constellation display (Off, Full, 1,2,3,4) To show the constellation diagram in measurement mode.

The Span value by default in cable is 50 MHz.

3. DVB Service

1. Mode: (Auto, Manual)
2. Video PIDs: (1-65535)
3. Audio PIDs: (1-65535)
4. PCR PID: (1-65535)
5. Program selection (only when tuned)

4. Spectrum configuration

1. Span: (10MHz, 20MHz, 50MHz, 100MHz, 200MHz, 500MHz, Full)
2. Marker values (Marker, Measure) To get the value of the marker in a punctual point (Marker) or the real value of the measurement of the channel (Measurement).
3. Sweep resolution: (Max, High, Medium, Low)
4. Detector mode: (Peak, sample, auto): Choose detection mode option in "Peak" for analogue signals / Detection mode in "Sample" for digital signals / "Auto": MDX Series will choose it automatically depending on the kind of signal.
5. RBW filter: (Auto, 0.2 MHz, 1 MHz, 2MHz) MDX 600
6. Spectrum marker mode: (Simple, Dual, Linked)

5. **Reference level** (Auto, 130 dB, 120dB, 110 dB, 100 dB, 90 dB, 80 dB, 70 dB)

6. **Group Name:** The name of the gropus stored in the Datalogger appears. Note: In case any gropu is created in the Datalogger, it won't be possible to navigate in group mode.

7. **Spectrum Active Marker:** Selection of the active marker in case of using double marker. MDX 600

With numeric entry active it is #0.

123/abc Numeric and alphabetic entry activator. When program mode selected, this key shows a menu for select directly one registered program.

back Cancel or return to previous action without modifying.

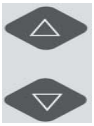
enter Confirm the selected option.

tv Display the picture of the tuned channel on the TFT monitor. If selected channel is digital, the monitor will represents the picture of the first transponder / multiplex program

spectrum Display the frequency spectrum on the monitor.

meter Display the measurements values of the selected signal. The information depends on the signal type:
Analog signals: Level, C/N, audio
Digital signals: Power, C/N, Quality (CSI), BER before and after Viterbi, MER

NOTE: with simultaneous activation of tv, spectrum and meter keys, is possible to display on the monitor spectrum, measurements and picture of the selected signal.



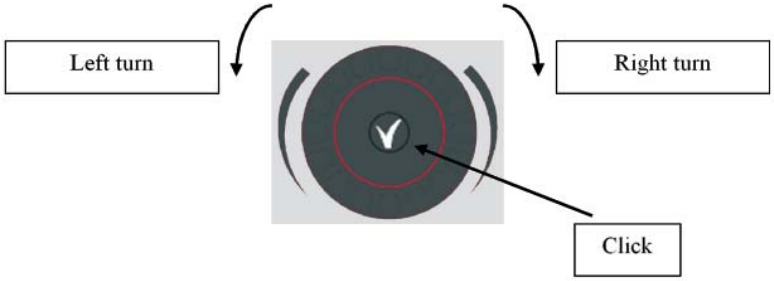
Up / down arrow keys Movement inside the OSD menu options. With digital signals, these keys allow to navigate through the differents programs' pictures.

Left / right arrow keys In picture mode, these keys allow to modify audio volume. In spectrum mode, they modify the span

on / off Meter switch on-off

6.2 CLICK ROTARY WHEEL

The click rotary wheel is one of the main MDX Series controls. It manages in an easy way the navigation through the menu options. The actions of the wheel are the following three: left turn, right turn and click functions. Using them is possible to manage the whole OSD menu.



Turning the wheel, it's possible to go up and down through the differents options of the menu. If monitor is showing a spectrum with signals, the wheel movements will sweep the band. A short click on the wheel it's interpreted as an OK (it confirms the selection); a long click cancels the action and goes out the OSD.

7 STATUS BAR

The status bar on top of the screen holds important information about meter status. It is always present, exception when in pure TV mode. It offers useful information about selected options, frequency, band, and battery status.

The following table shows the icon and the functions of each of them:

Band
Information about the selected frequency band

Cable band (5-862 MHz)

Terrestrial band (47-862 MHz)

Satellite band (900-2150 MHz) MDX 500
(863-2150 MHz) MDX 600

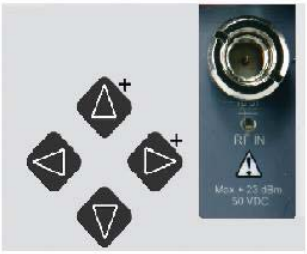
It shows the real level of battery

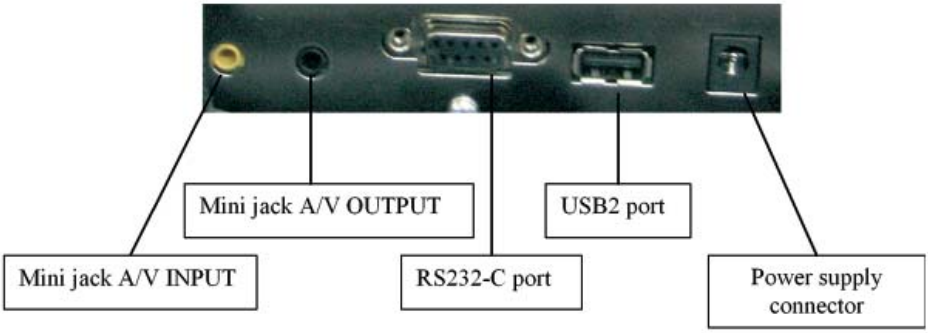
8 CONNECTIONS

The meter front panel is equipped with a F-male high quality connector for the input coaxial cable. Connect the F-F female adaptor before to connect the cable with the input RF signal.



On the right side, the meter is equipped with the following connectors:

- Audio/video mini-jack input connector
- Audio/video mini-jack output connector
- RS232-C DB9 serial port for updating and calibration operations
- USB2 port for technical support and uploading/downloading data
- Power supply connector



NOTE: For **enabling/disabling the external video input** you should push the key **"3 Image"** and navigate up to the **"External Video"** option. Please, select between On/Off to enable/disable the external video input through the Mini Jack A/V IN connector.

Support for External Hard Disks USB 2.0 directly fed from the meter

The MDX Series is capable of feeding the external hard disks USB 2.0 always that they respect the limitation of current to 500 mA established in the USB norm.

9 OPERATING WITH THE METER

9.1 First time operation

Before using your meter for the first time, please charge it completely (follow the indications in the chapter "Meter's Power Supply" (The battery is completely charged at the factory once the meter is finished, but the battery may be low when you purchase it).

9.2 Meter starting up

The **MDX Series** field strengh meter is ready to begin work with it, therefore there is not any kind of installation to do for starting it up.

Press the ON/OFF key to switch on the meter. The power may be supplied through the mains or through the internal battery.

Once it has been switched on, the monitor shows a picture with Ankaro logo, meter serial number and current firmware version. This information is important if customer service is requested for technical support regarding the meter.

9.3 Factory default

You can find this option in the menu "Set Up --> System --> Default Values". Once you have selected it, it resets the meter, getting back to the factory default values.

After executing the Default Values, the following screen will be shown:

In this screen you can select the languages of the menus, the RF Standard, the Date and the Time of the meter. Use the rotary key to change them and select the correct values.

ENGLISH

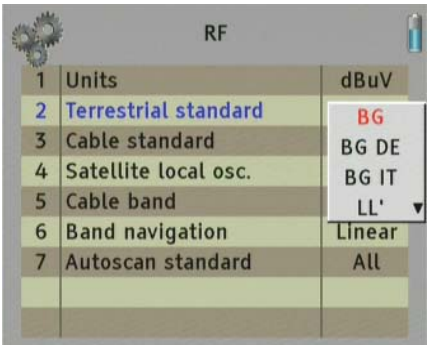
9.4 RF cable connection

Connect the input RF coaxial cable to RF-IN F connector, once the F-F female adaptor has been installed.

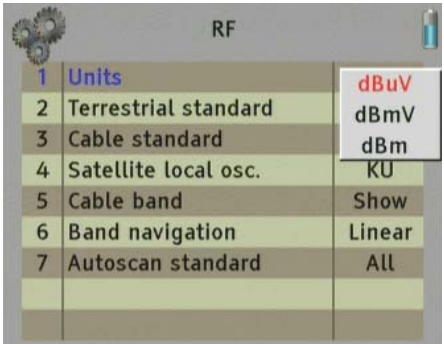
If necessary, for future replacement of the adaptor it's important to installa a high quality adaptor that don't disturb input signal or create impedance problems. In this way it will be possible supply the meter with a real quality RF signal.

9.5 TV standard setup

It's important to setup the right TV standard in order to work correctly with the meter. It's possible also to setup the measurement units. To do it, press "setup" key on the front panel. After this, select "RF" option using the rotary wheel. Finally, select the second option "Terrestrial standard" and accept clicking on the wheel.

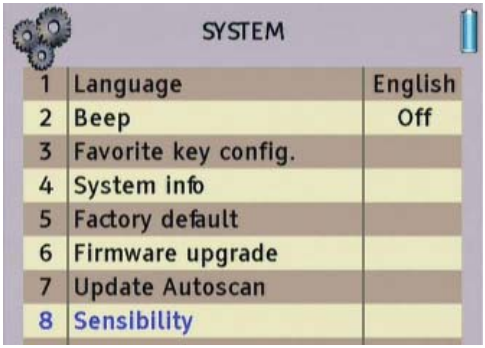


Measurement units could be selected pressing "setup" key and selecting "units" option. The available options are dBuV, dBmV and dBm based on user's preference.

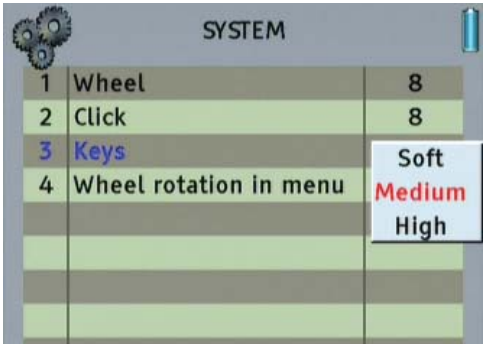


9.6 Sensibility

In order to access to this tool, press the 5 key "setup" and select the "System" option. Later, select the "Sensitivity" option.



In the sensitivity menu, the next option will appear: In the sensitivity menu, the next option will appear:



9.6.1 WHEEL

It is used for adjusting the turning speed of the wheel. The value that can be chosen is between 1 and 16.

9.6.2 CLICK

It is used for adjusting the sensitivity of the wheel when you press frontally over it. The value that can be chosen is between 1 and 16.

9.6.3 KEYS

Select the sensitivity of the keyboard. You can choose Low, Medium and High sensitivity.

9.6.4 WHEEL ROTATION IN MENU

The movements in the menus can be done by turning the wheel. You can choose the direction of the turn. The options are: Normal (it moves downwards turning the wheel in counter clockwise) or Inverted (it moves downwards turning the wheel anticlockwise).

10 MEASUREMENTS

Some of the parameters while you are measuring are configured independently in each band (ter-sat-catv). These parameters are the following ones: Vrf, 22KHz, DiSEqC switch, Carrier Mode, RBW Filter, Spectrum Resolution, Detector mode spectrum, and Span of the spectrum.

The available measurements of **MDX Series** are the following:

TERRESTRIAL BAND

1.- Analog signal

1. Level
2. Video
3. Audio
4. Video / audio difference
5. C/N
6. Sync pulse

2.- Digital signal

1. Power
2. C/N (digital measurement)
3. Noise Margin
4. BER before Viterbi
5. BER after Viterbi
6. MER
7. Errors

SATELLITE BAND

1.- Analog signal

1. Level
2. C/N
3. Sync pulse

2.- Digital signal

1. Power
2. C/N (digital measurement)
3. Noise Margin
4. BER before Viterbi
5. BER after Viterbi
6. MER
7. Errors

CABLE BAND

1.- Analog signal

1. Level
2. Video
3. Audio
4. Video / audio difference
5. C/N

2.- Digital signal

1. Power
2. Noise Margin
3. BER before Viterbi
4. MER
5. Errors

Note: Noise Margin is defined as the difference between the value of the current C/N and the value of the C/N in the pixelation point of the signal. That is, is the quantity of dB's of the C/N measure that is missing until losing the signal.

10.1 TERRESTRIAL SIGNAL MEASUREMENT

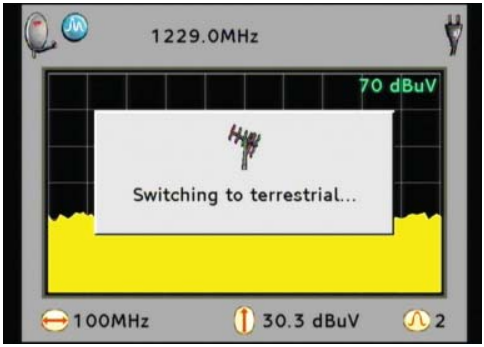
10.1.1 Frequency band selection

It's possible to know if terrestrial band it has been already selected. The status bar represents a logo (different for each band) that allow to know which band has been selected. There are three differents options:

1. If logo shows a terrestrial antenna, then terrestrial band is selected.
2. If logo shows a coaxial cable, then cable band is selected.
3. If logo shows a satellite antenna, then satellite band is selected.

The status bar is hidden if only TV mode is selected. To make it appears, press **"tv"** key.

For terrestrial band selection, press one or several times **"band"** key until the monitor shows the message "Switching to terrestrial band". The switching sequence is the following:



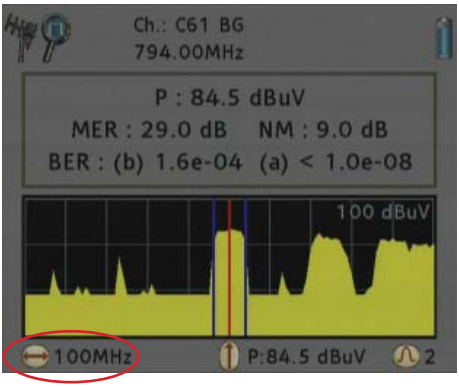
Note: If cable band is not necessary for the installer, there's a menu option that allow to hide it (**"setup>RF>Cable band"**).

10.1.2 Use spectrum mode to spot a signal

To represent the frequency spectrum on the screen and spot a signal, press the **"spectrum"** key. When this selection is active, the green led over the key will be switched on.

In case of **"tv"** and **"meter"** keys are also switched on, the monitor shows a simultaneous representation of spectrum, picture and signal measurements. If these options are not necessary at the moment, it's possible to switch them off pressing the corresponding keys.

To identify a signal, to do it with a span of 50 MHz is advised (default value in terrestrial). For select it, use left and right arrows keys. The span current value is shown at the left bottom part of the monitor.



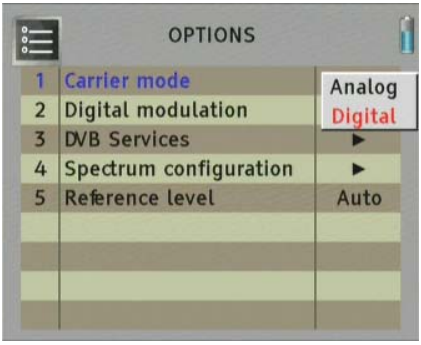
With the spectrum on screen, move the rotary wheel to sweep the frequency band to spot the target signal. In order to semplify the navigation through the terrestrial band, press the **"nav"** key for select channel mode or frequency mode.

- Channel mode allows to sweep the frequency band by channel defined in the standard
- Frequency mode allows to sweep the band normally by frequency with 50 KHz steps

10.1.3 Measurement selection

With the target signal identified, it's necessary to select the signal type (analog or digital). Press **"options"** key, select "Carrier mode" and there will be two differents options:

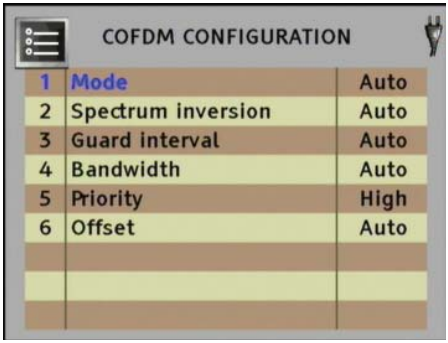
1. **Analog**: if analog signal
2. **Digital**: if digital signal



Select one of them and confirm clicking the wheel.

For digital terrestrial television signal, it is necessary setup signal parameters. Select **"Digital modulation"**. The adviced configuration is setup the following options in automatic mode.

1. **Mode: auto**
2. **Spectrum inversion: auto**
3. **Guard interval: auto**
4. **Bandwidth: auto**
5. **Priority: high**
6. **Offset: auto**

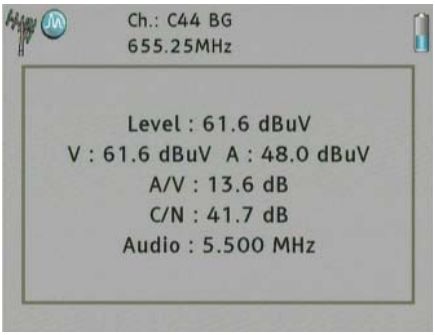


Press **"back"** key to turn back the main menu.

10.1.4 Make measurements

1.- Analog signals

To get analog terrestrial signal measurements, spot the signal as explained above and press **"meter"** key. It switches on the led over the key and the monitor and the monitor shows a screen with measures values.



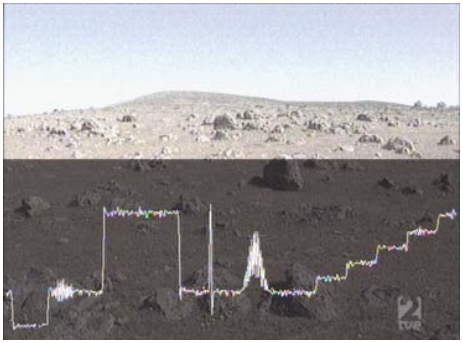
If **"tv"** and **"spectrum"** are selected (the led over these keys are switched on), the monitor shows a simultaneous representation of measurements, spectrum and picture. If these two options are not necessary, is possible to cancel their represetantion pressing the corresponding keys.

The meter represents the following analog values:

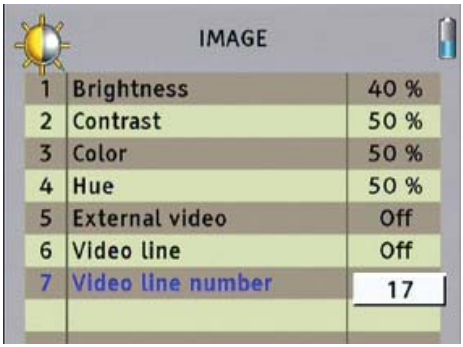
- Level
- Video
- Audio
- Video / audio difference
- C/N

Video Line MDX 600

In analogue signals, you can overlap to the picture of the tuned channel, the oscillograme of one of the lines of the composed video.

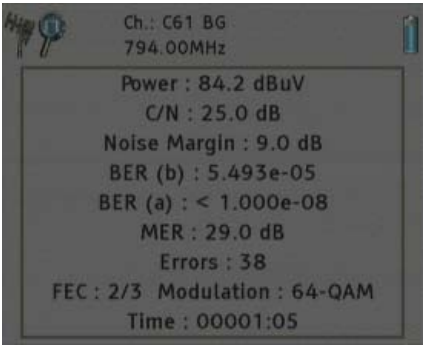


The activation of this feature is carried out from "Video Line" in the "IMAGE" menu. The line to be showed is selected in the option "Video Line Number" of the same menu.



2.- Digital signals

To get digital terrestrial signal measurements, spot the signal as explained above and press **"meter"** key. It switches on the led over the key and the monitor and the monitor shows a screen with measures values.



If **"tv"** and **"spectrum"** are selected (the led over these keys are switched on), the monitor shows a simultaneous representation of measurements, spectrum and picture. If these two options are not necessary, is possible to cancel their represetantion pressing the corresponding keys.

The meter represents the following digital values:

- Power
- C/N
- Noise Margin
- BER before Viterbi
- BER after Viterbi
- MER
- Errors

10.1.5 Picture representation

The **MDX Series** meter is equipped with three differents representation modes to show the information on the screen: **"tv"**, **"spectrum"** and **"meter"**.

There is a led over these buttons that inform the user which options are being currenntly used. At least one of them will be always switched on.

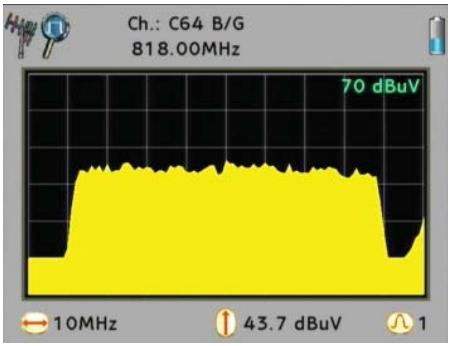
Their functions could be also combined and based on the measurement type, the information shown will be different.

Representation possibilities are the following:

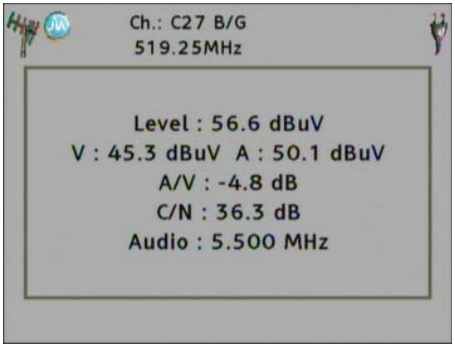
1.- "tv" key active. Activates and desactivates the TV monitor mode, showing the image of the selected signal. In case of digital carriers, this mode will represent the first program of FTA (free to air) terrestrial multiplex and satellite transponders. If coded signal, the image will not be represented.

Status bar is present for a short period of time; after it will be hidden. To makes it appear again, press **"tv"** key.

2.- "spectrum" key active. The monitor is divided in three parts: status bar on top, spectrum and at the bottom span, level and resolution filter information.

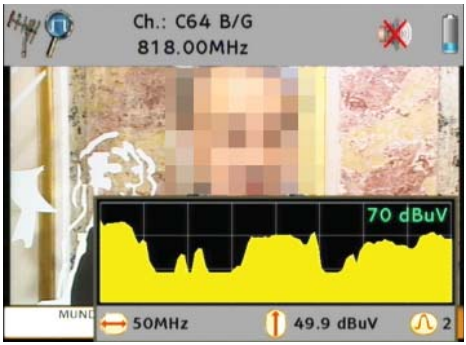


3.- "meter" key active. The monitor is divided in two parts: status bar and signal measurements information.



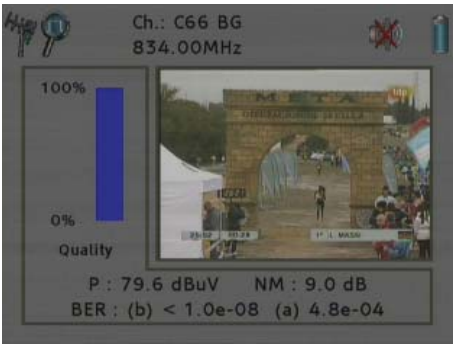
These three options could be combined as follow:

1.- "tv" and "spectrum". This two options together represents signal picture (in case of digital carriers, this mode will represent the first program of FTA (free to air) terrestrial multiplex and satellite transponders) and frequency spectrum. For analog signals, this option does not show the image.



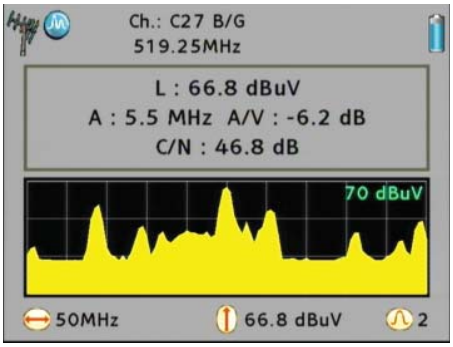
2.- "tv" and "meter". These two active options represents image and measurements.
For **analog signals** the monitor is divided in four areas: status bar, syncro pulse, channel picture and graphic bar with signal level.

With **digital signals** the monitor represents three differents sections: status bar, picture of the first program of FTA (free to air) digital carriers, and one section with measurements (Power, Noise Margin, BER before and after Viterbi and graphic bar with Quality.

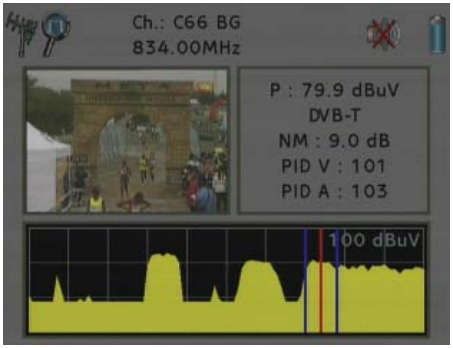


Note: The quality graphic bar is based on the Noise Margin measure. As long as the Noise Margin measure is equal or higher the maximum value that the meter is able to represent, the bar will be shown in 100%.

3.- "spectrum" and "meter". With these two options the monitor is divided in differents horizontal sections showing the status bar, channel measurement values (differents if analog or digital signal), spectrum, span and current resolution filter.



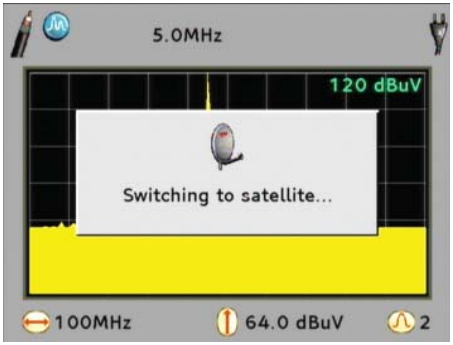
4.- "tv", "spectrum" and "meter". This representation mode offers the most versatile information about the signal that has been measured. It represents on the monitor the status bar, signal image, spectrum and signal measurement information. For analog signals, this option does not show the image.



10.2 Satellite signal measurement

10.2.1 Frequency band selection

For satellite band selection, press one or several times **"band"** key until the monitor shows the message "Switching to satellite band". The switching sequence is the following:



Once this option has been selected, a satellite dish appears on the left top of the status bar.

10.2.2 Supply LNB power

With satellite band it is important supply power to LNB in order to get the signal from the differents satellite band and polarities.

- Polarity. There are two options:
  1. **Vertical:** 13 V
  2. **Horizontal:** 18 V

- Bands. There are two options:
  1. **High:** 22 KHz tone
  2. **Low:** Without tone

To active the LNB power supply, press through RF-IN connector, press "supply" key to open the menu.

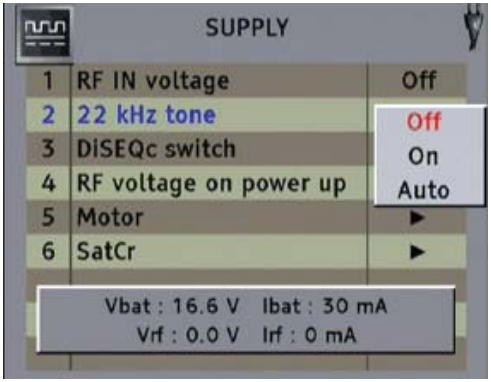
Inside the menu, select **"RF IN voltage"**. It allows to select the following voltage options:

1. Off
2. 5V
3. 13V
4. 18V

Select the right voltage for the polarity needed and click the wheel to confirm.

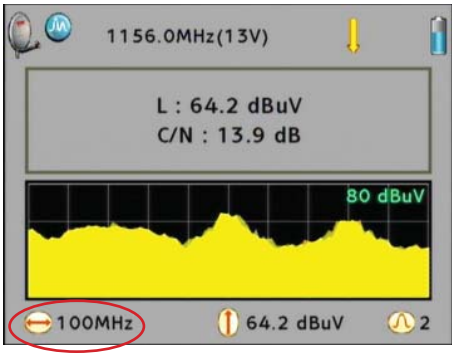
In order to select the high band sending 22 KHz tone, select the option "22 KHz tone", that represents the following options:

- Off: Without tone
- On: Send 22 KHz to through RF-IN
- Auto: Send 22 KHz in automatic mode if the menu "setup>RF>satellite local oscilator" has been selected KU band or satellite band. The default value of this option is KU band.



10.2.3 Use spectrum mode to spot a signal

To represent the frequency spectrum on the screen and spot a signal, press the **"spectrum"** key. When this selection is active, the green led over the key will be switched on.
In case of **"tv"** and **"meter"** keys are also switched on, the monitor shows a simultaneous representation of spectrum, picture and signal measurements. If these options are not necessary at the moment, it's possible to switch them off pressing the corresponding keys.
To identify the target signal, an easy way could be use 100MHz bandwidth span. For select it, use left and right arrows keys. The span current value is shown at the left bottom part of the monitor.



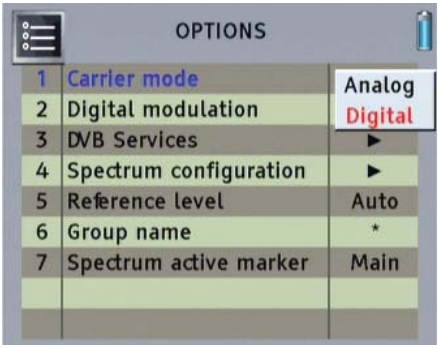
With the spectrum on screen, move the rotary wheel to sweep the frequency band to spot the target signal. If only spectrum is needed on the monitor, press the buttom **"spectrum"** to active it. It is possible also to desactive **"tv"** and **"meter"** modes if just spectrum is necessary.

In satellite band, **"nav"** key selects only frequency mode to sweep the band normally by frequency with 500 KHz steps.

10.2.4 Measurement selection

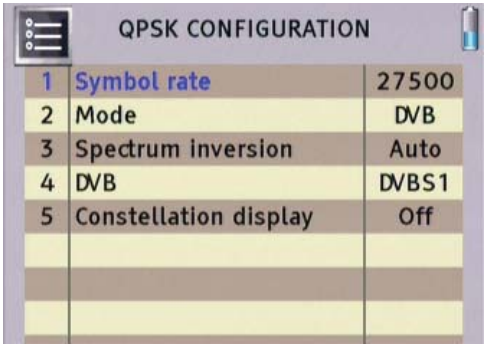
With the target signal identified, it's necessary to select the signal type (analog or digital). Press **"options"** key, select **"Digital modulation"** and there will be two differents options:

- Analog: if analog signal
- Digital: if digital signal



Select one of them and confirm clicking the wheel.

For digital satellite signal, it is necessary setup signal parameters. Select "Digital modulation". It is necessary to setup symbol rate and mode:

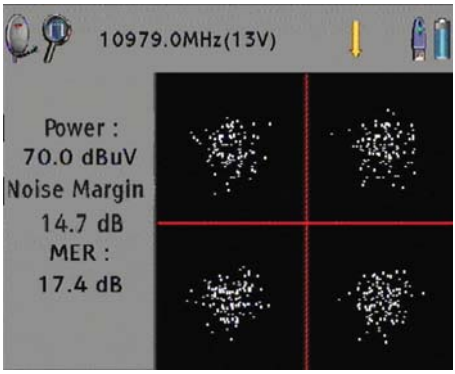


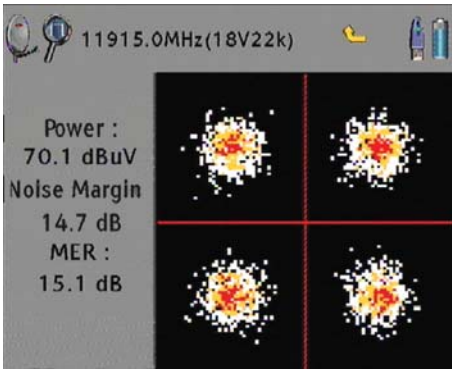
- Symbol rate: This value should be fixed based on broadcaster information
- Mode: DVB, DSS. Normally DVB will be used.
- Spectrum inversion: auto
- DVB: To switch between the modes DVB-S and DVB-S2. MDX 600
- Constellation display MDX 600: In this option you can choose the type of displaying of the constellation.

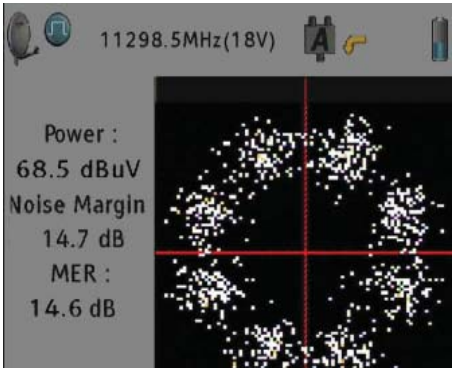
Pushing on the field “Constellation Display” you can select:

- **Off:** Disables the viewing of the constellation.
- **Full:** Allows watching the 4 parts of the diagram (4 quadrants).
- **1:** Allows watching the fi rst quadrant (higher – left).
- **2:** Allows watching the second quadrant (higher – right).
- **3:** Allows watching the third quadrant (lower – right).
- **4:** Allows watching the forth quadrant (lower – left).

Once selected the quadrant to be represented, exit of the menu, and select the **“meter”** mode to be able to see the constellation on the TFT monitor.







Press **“back”** key to turn back the main menu

10.2.5 Make measurements

1.- Analog signals

To get analog satellite signal measurements, spot the signal as explained above and press **"meter"** key. It switches on the led over the key and the monitor and the monitor shows a screen with measures values.

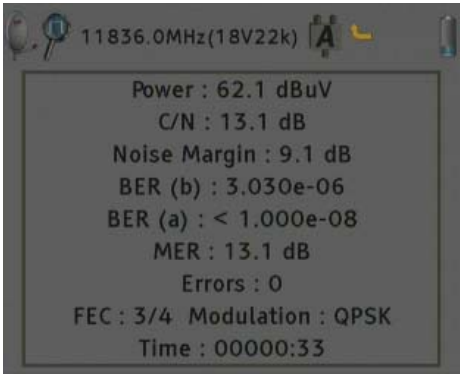
If **"tv"** and **"spectrum"** are selected (the led over these keys are switched on), the monitor shows a simultaneous representation of measurements, spectrum and picture. If these two options are not necessary, is possible to cancel their represetantion pressing the corresponding keys.

The meter represents the following analog values:

- Level
- C/N

2.- Digital signals

To get digital satellite signal measurements, spot the signal as explained above and press **"meter"** key. It switches on the led over the key and the monitor and the monitor shows a screen with measures values.



If **"tv"** and **"spectrum"** are selected (the led over these keys are switched on), the monitor shows a simultaneous representation of measurements, spectrum and picture. If these two options are not necessary, is possible to cancel their represetantion pressing the corresponding keys.

The meter represents the following digital values:

- Power
- C/N
- Noise Margin
- BER before Viterbi
- BER after Viterbi
- MER
- Errors

10.2.6 Picture representation

The **MDX Series** meter is equipped with three differents representation modes to show the information on the screen: **"tv"**, **"spectrum"** and **"meter"**.

There is a led over these buttons that inform the user which options are being currenntly used. At least one of them will be always switched on.

Their functions could be also combined and based on the measurement type, the information shown will be different.

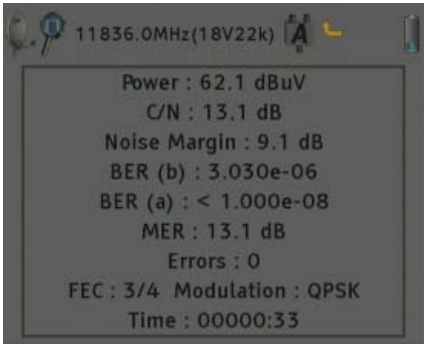
Representation possibilities are the following:

1.- "tv" key active. Activates and desactivates the TV monitor mode, showing the image of the selected signal. In case of digital carriers, this mode will represent the first program of FTA (free to air) terrestrial multiplex and satellite transponders. If coded signal, the image will not be represented.

Status bar is present for a short period of time; after it will be hidden. To makes it appear again, press **"tv"** key.

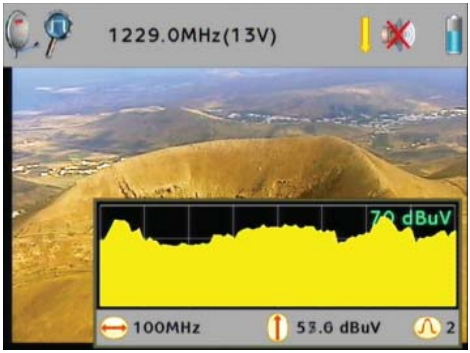
2.- **"spectrum"** key active. The monitor is divided in three parts: status bar on top, spectrum and at the bottom span, level and resolution filter information.

3.- **"meter"** key active. The monitor is divided in two parts: status bar and signal measurements information.



These three options could be combined as follow:

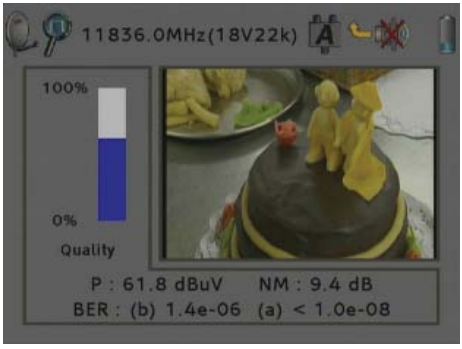
1.- **"tv"** and **"spectrum"**. This two options together represents signal picture (in case of digital carriers, this mode will represent the first program of FTA (free to air) terrestrial multiplex and satellite transponders) and frequency spectrum. For analog signals this option does not show the image.



2.- **"tv"** and **"meter"**. These two active options represents image and measurements.

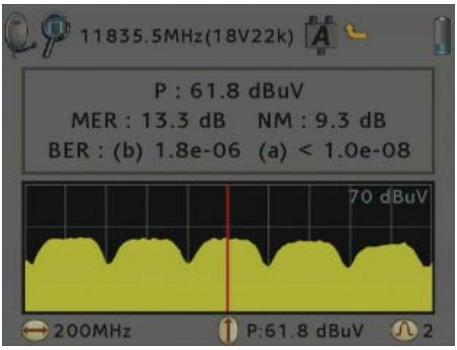
For **analog signals** the monitor is divided in four areas: status bar, syncro pulse, channel picture and graphic bar with signal level.

With **digital signals** the monitor represents three differents sections: status bar, picture of the first program of FTA (free to air) digital carriers, and one section with measurements (power, Noise Margin, BER before and after Viterbi and graphic bar with Quality.



Note: The quality graphic bar is based on the Noise Margin measure. As long as the Noise Margin measure is equal or higher the maximum value that the meter is able to represent, the bar will be shown in 100%.

3.- **"spectrum"** and **"meter"**. With these two options the monitor is divided in differents horizontal sections showing the status bar, channel measurement values (differents if analog or digital signal), spectrum, span and current resolution filter.



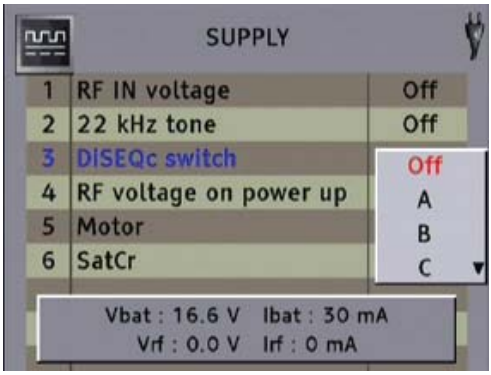
4.- **"tv"**, **"spectrum"** and **"meter"**. This representation mode offers the most versatile information about the signal that has been measured. It represents on the monitor the status bar, signal image, spectrum and signal measurement information. For analog signals this option does not show the image.

10.2.7 DiSEqC switch

When DiSEqC satellite switches are installed, it's necessary to use commands according this standard to get the signal from satellite LNB.

If the meter detects that the cable has been disconnected and connected again, resend the DiSEqC information to select the correct switch.

The **MDX Series** is equipped with an option inside the menu "supply" that allow to send these commands.



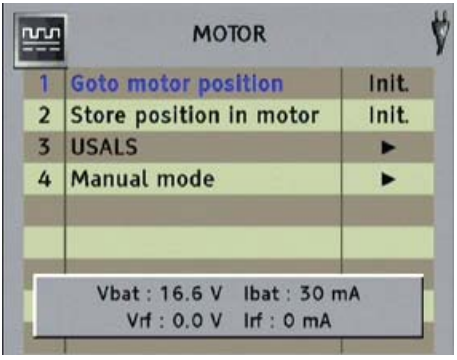
Press "supply" key and select "DiSEqC switch" option. It will show the following options:

- Off: No active
- A: Select switch A
- B: Select switch B
- C: Select switch C
- D: Select switch D

10.2.8 Motor Control

Using the **DiSEqC 1.2** commands, it is possible to control one motorized positioner.

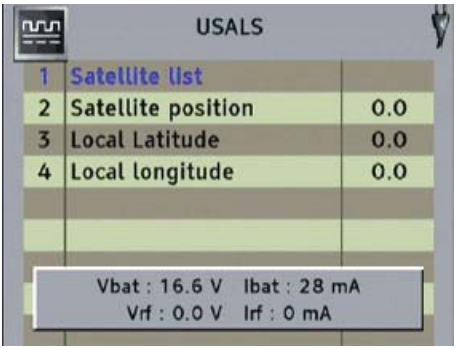
To use it, it is necessary that you select the Satellite Band in the meter, and activate the feeding of the LNB, needed for the motor.



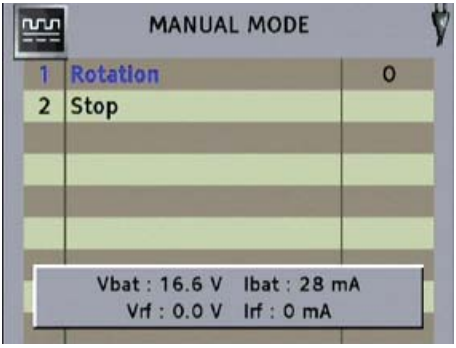
The first option of the menu allows the positioning of the antenna at any of the positions fixed in the memory of the motor. When you activate it, the concerning DiSEqC command is sent to the motor.

With the option 2, we can save the current position of the motor at any empty space of its internal memory.

The option 3 gathers the options of the **USALS** system (Universal Satellites Automatic Location System). In this case, after giving the current latitude and longitude data, the motor will be able to calculate the correct position of the satellites gotten in their internal list. To adjust it, you just need to direct the antenna towards any known satellite, which will be the reference.

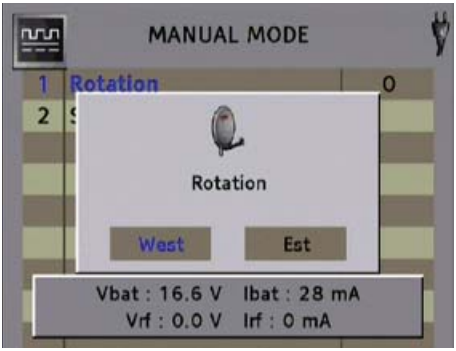


The **manual mode** (option 4 of the MOTOR menu) allows the simple control of the turning of the positioner.



The **Rotation** value indicates the number of motor steps to be turned, towards East if the value is positive, or towards West if it is negative.

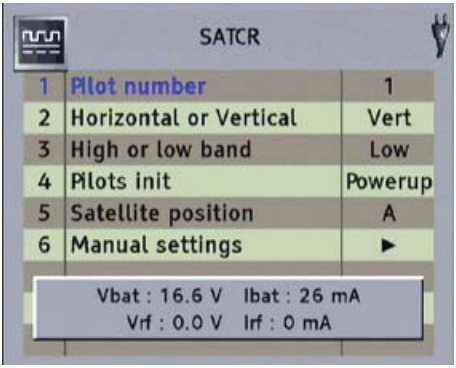
A Zero value indicates a constant turning to East or West, stopping when you push Enter again.



10.2.9 SatCR (satellite channel router) - Unicable

SatCR or Unicable is an extension of the protocol DiSEqC oriented to control the LNB, allowing to combine and distribute up to 8 different input signals.
Through one single coaxial cable, it is possible to bring the signal, from 1 or more dishes, to 8 different receivers. For example, applied to PVRs with twin tuner, it allows watching one channel meanwhile another one is recorded without the necessity of distributing 2 cables from the LNB to the receiver.

One device SatCR works shifting the frequency of the input signal to another fixed intermediate frequency, generating a narrow output sub band which will be called "pilot". Combining different SatCR devices, these pilots, which can belong to different LNB, with different polarizations, can be multiplexed and distributed through one single cable.



The option **"Pilot number"** allows selecting some of the available pilots.

Through the **options 2 and 3**, we will select the polarity and band of the transponder we want to associate with the selected pilot.

The option **"Initialize pilots"** allows defining when the information exchange will happen (information between LNB and the meter, being their option **Never, Always** and **Start**). In this exchange, the LNB informs about its basic features, like the number and frequency of the used pilots.

In case of one intermediate switch, the **option 5** allows selecting one of their positions.

Finally, the **option 6** allows adjusting the rest of parameters in each one of the 8 possible pilots.

The option **"Init"** forces the starting of the identification of performance of the LNB previously explained.

The **options 2 and 3** allow selecting the active pilots.

In the **option 5** we will select the frequency of the transponder that we want to transmit through the selected pilot.

In the **option 6**, we should fix the frequencies of the Local Oscillator which corresponds to the connected LNB.

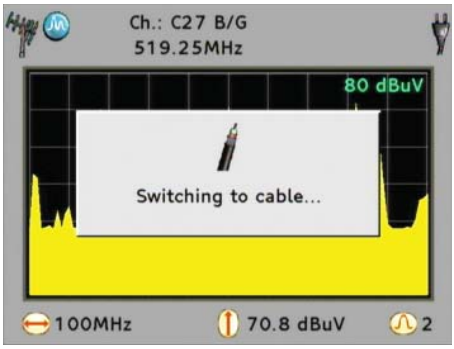
Navigation Mode in SatCR
Through the key **"nav"** we accede to different types of navigation through the spectrum. If we select **"SatCR Mode"**, when we turn the rotary key, we are actuating over the transponder frequency associated to the active pilot. The band identifier of the top-left part will change to indicate this mode.

10.3 CABLE SIGNAL MEASUREMENTS

10.3.1 Frequency band selection

For cable band selection, press one or several times **"band"** key until the monitor shows the message **"Switching to satellite band"**. The switching sequence is the following:

Terrestial band -> Cable band -> Satellite band



Once this option has been selected, a cable logo appears on the left top of the status bar.

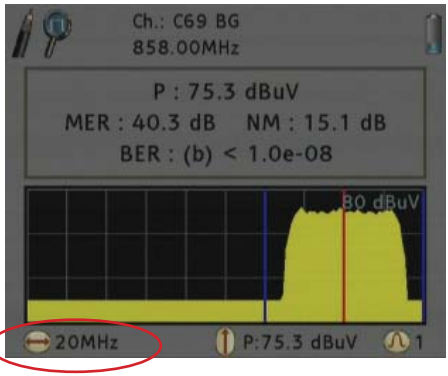
In case of the meter doesn't show the above message, it could be necessary to go into the **"setup"** menu, select **"RF"** option and active **"show cable band"**.

10.3.2 Use spectrum mode to spot a signal

To represent the frequency spectrum on the screen and spot a signal, press the **"spectrum"** key. When this selection is active, the green led over the key will be switched on.

In case of **"tv"** and **"meter"** keys are also switched on, the monitor shows a simultaneous representation of spectrum, picture and signal measurements. If these options are not necessary at the moment, it's possible to switch them off pressing the corresponding keys.

To identify a signal, to do it with a span of 50 MHz is advised (default value in cable). For select it, use left and right arrows keys. The span current value is shown at the left bottom part of the monitor.



With the spectrum on screen, move the rotary wheel to sweep the frequency band to spot the target signal. If only spectrum is needed on the monitor, press the buttom **"spectrum"** to active it. It is possible also to desactive **"tv"** and **"meter"** modes if just spectrum is necessary.

In cable band, **"nav"** key selects only frequency mode to sweep the band normally by frequency with 100 KHz steps.

10.3.3 Measurement selection

With the target signal identified, it's necessary to select the signal type (analog or digital). Press **"options"** key, select **"Carrier mode"** and there will be two differents options:

- Analog: if analog signal
- Digital: if digital signal

Select one of them and confirm clicking the wheel.

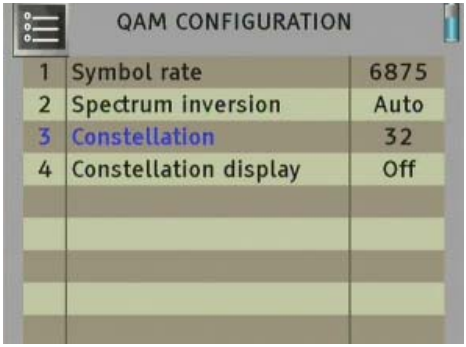
For digital cable signal, it is necessary setup signal parameters. Select “Digital modulation”. It is necessary to setup the following parameters:

1. **Symbol rate:** This parameter should be fixed according to the Bit Rate (symbol rate) of the channel, data which is supplied by the operador.

2. **Spectrum inversion:** Pushing on this field, you can see the following options:
   - Auto: Enables the automatic way of spectrum inversion.
   - On: Enables the manual way of spectrum inversion.
   - Off: Disables the manual spectrum inversion.

   You should enabled in case it is necessary to invert the spectrum. If you select incorrectly the inversion of the spectrum, the reception will be not correct.

3. **Constellation:** This parameter will be fixed according to the modulation of the channel. This data is supplied by the operator of the channel. You can select different constellations (modulations): 16-QAM, 32-QAM, 64-QAM, 128-QAM y 256-QAM.



4. **Show the Constellation:** In this option you can choose the type of displaying of the constellation. Pushing on the field “Constellation Display” you can select:

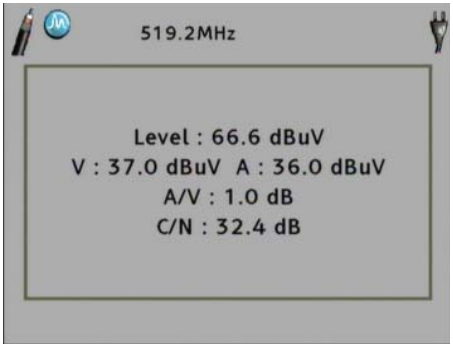
   - **Off:** Disables the viewing of the constellation.
   - **Full:** Allows watching the 4 parts of the diagram (4 quadrants).
   - **1:** Allows watching the first quadrant (higher – left).
   - **2:** Allows watching the second quadrant (higher – right).
   - **3:** Allows watching the third quadrant (lower – right).
   - **4:** Allows watching the forth quadrant (lower – left).

Once selected the quadrant to be represented, exit of the menu, and select the **"meter"** mode to be able to see the constellation on the TFT monitor.

10.3.4 Make measurements

1.- Analog signals

To get analog cable signal measurements, spot the signal as explained above and press "meter" key. It switches on the led over the key and the monitor and the monitor shows a screen with measures values.



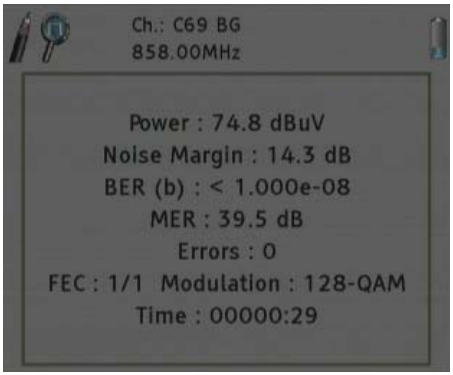
If **"tv"** and **"spectrum"** are selected (the led over these keys are switched on), the monitor shows a simultaneous representation of measurements, spectrum and picture. If these two options are not necessary, is possible to cancel their represetantion pressing the corresponding keys.

The meter represents the following analog values:

- Level
- Video
- Audio
- Video / audio difference
- C/N

2.- Digital signals

To get digital cable signal measurements, spot the signal as explained above and press "meter" key. It switches on the led over the key and the monitor and the monitor shows a screen with measures values.



If **"tv"** and **"spectrum"** are selected (the led over these keys are switched on), the monitor shows a simultaneous representation of measurements, spectrum and picture. If these two options are not necessary, is possible to cancel their represetantion pressing the corresponding keys.

The meter represents the following digital values:

- Power
- Noise Margin
- BER before Viterbi
- MER
- Errors

10.3.5 Picture representation

The **MDX Series** meter is equipped with three differents representation modes to show the information on the screen: **"tv"**, **"spectrum"** and **"meter"**.

There is a led over these buttons that inform the user which options are being currenntly used. At least one of them will be always switched on.

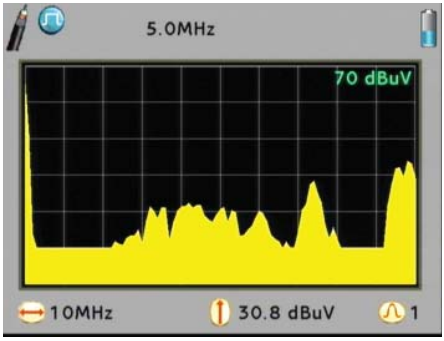
Their functions could be also combined and based on the measurement type, the information shown will be different.

Representation possibilities are the following:

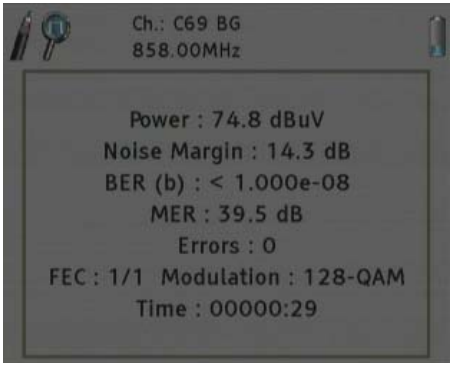
1.- "tv" key active. Activates and desactivates the TV monitor mode, showing the image of the selected signal. In case of digital carriers, this mode will represent the first program of FTA (free to air) terrestrial multiplex and satellite transponders. If coded signal, the image will not be represented.

Status bar is present for a short period of time; after it will be hidden. To makes it appear again, press **"tv"** key.

2.- "spectrum" key active. The monitor is divided in three parts: status bar on top, spectrum and at the bottom span, level and resolution filter information.

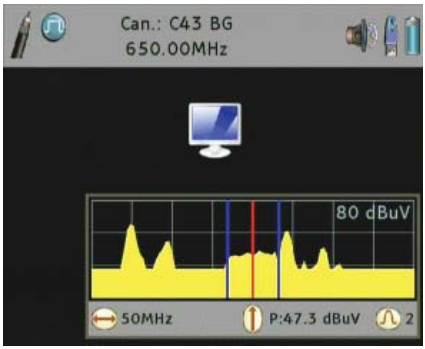


3.- **"meter"** key active. The monitor is divided in two parts: status bar and signal measurements information.



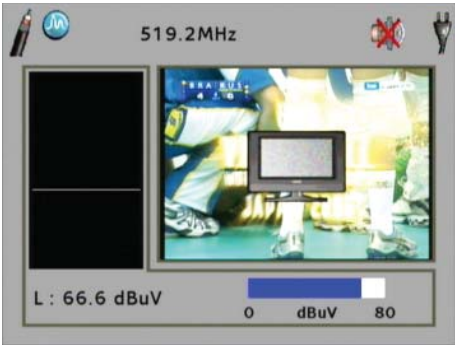
These three options could be combined as follow:

1.- "tv" and "spectrum". This two options together represents signal picture (in case of digital carriers, this mode will represent the first program of FTA - free to air) and frequency spectrum. For analog signals this option does not show the image.

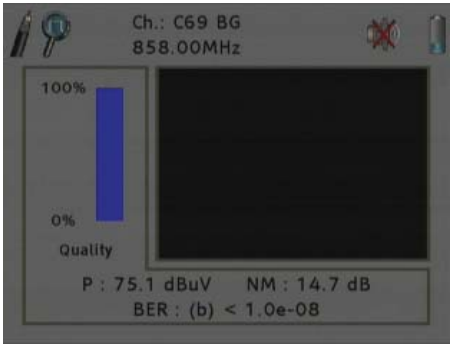


2.- "tv" and "meter". These two active options represents image and measurements.

For analog signals the monitor is divided in four areas: status bar, syncro pulse, channel picture and graphic bar with signal level.

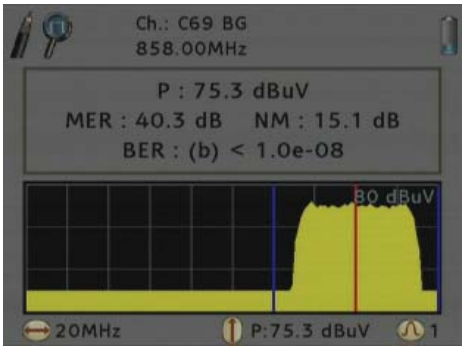


With digital signals the monitor represents three differents sections: status bar, picture of the first program of FTA (free to air) digital carriers, and one section with measurements (power, Noise Margin, BER before Viterbi and graphic bar with Quality.

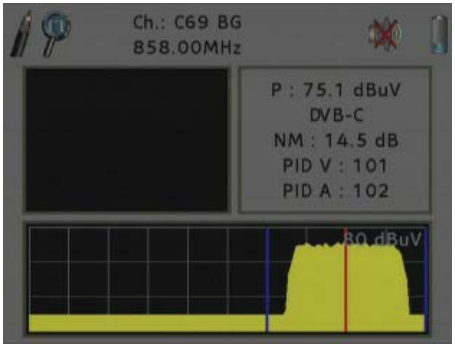


Note: The quality graphic bar is based on the Noise Margin measure. As long as the Noise Margin measure is equal or higher the maximum value that the meter is able to represent, the bar will be shown in 100%.

3.- "spectrum" and "meter". With these two options selected the monitor is divided in differents horizontal sections showing the status bar, channel measurement values (differents if analog or digital signal), spectrum, span and current resolution filter.



4.- "tv", "spectrum" and "meter". This representation mode offers the most versatile information about the signal that has been measured. It represents on the monitor the status bar, signal image, spectrum and signal measurement information. For analog signals this option does not show the image.



10.4 FM SIGNAL

10.4.1 Frequency band selection

In order to select FM frequencies, it's important to follow the following steps:

1. Press **"band"** key to select terrestrial band. It will show terrestrial antenna logo on left top.

2. Press **"option"** key, select **"Carrier mode"** and **"Analog"**.

3. Select audio menu pressing **"sound"** key and select **"carrier frequency"** and **"FM"**. Press click wheel or **"enter"** key to confirm.

Note: In order to hear again analog TV audio, select "5.50" value in previous menu.

Select **"tv"** mode, unselecting **"meter"** and **"spectrum"** modes.

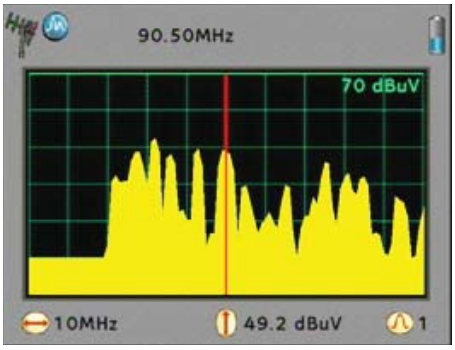
Press **"nav"** key to select frequency mode. If this mode is selected, the status bar will show the value in MHz. If channel mode is selected, it will be shown on status bar through a channel value (i.e CH: 32 B/G).

Select FM frequency in 87,5 MHz - 108 MHz band. If signal is connected, radio channel will be listened.

10.4.2 Signal measurement

To make a FM signal measurement, press **"meter"** key once FM mode has been selected. In the bottom of the screen it will be shown the signal measurement.

To show spectrum on screen, press **"spectrum"** key. It's recomended to use a span value of 10 MHz to have a clear graphic information of differents signals.

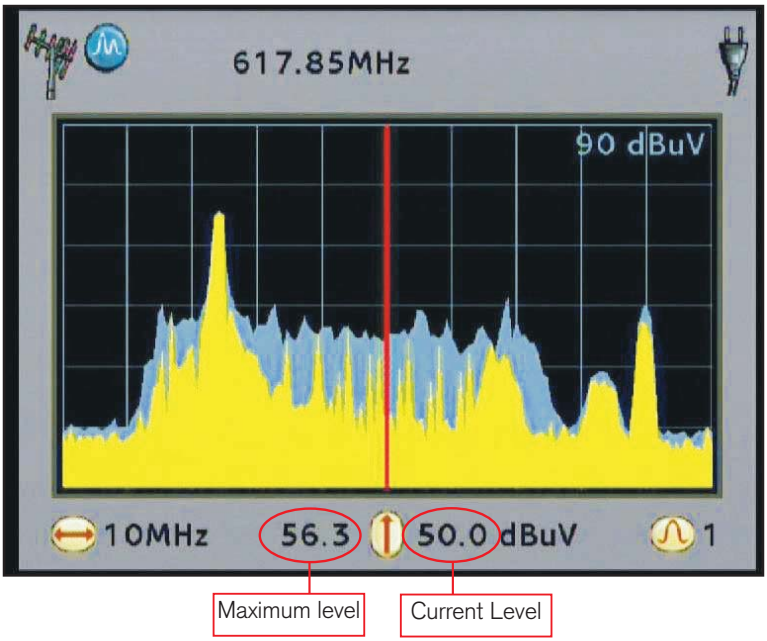


Important: if spectrum mode or meter mode are selected, FM audio will not be active.

10.5 Selecting the viewing of the spectrum in “Maximums” mode MDX 600

MDX 600 is provided with a new representation of the spectrum, named “Maximums” mode. In this mode it is represented the spectrum in Real Time as well as the representation in Grey colour of the maximum measured values for each frequency.

To select the spectrum mode “Maximums” push the button “Options” at front panel (or push the rotary key from any of the measurement windows), and select option 4 “Spectrum confi guration”. Select then in the option 4 “Detection Mode” and fi x it in “Maxim”.



The value of the maximum values will be deleted on the screen each time that the marker shift from the current window. Also you can force a deleting of the maximum values on the screen pushing the “Back” key.

Note: When the mode “Maximums” is selected, the automatic attenuator will be automatically disabled and it passes from the real time spectrum detection to the Peak mode. In case of variation of the reference level, use the cursor keys “Up/Down”.

This mode is especially interesting to detect sporadic noise.

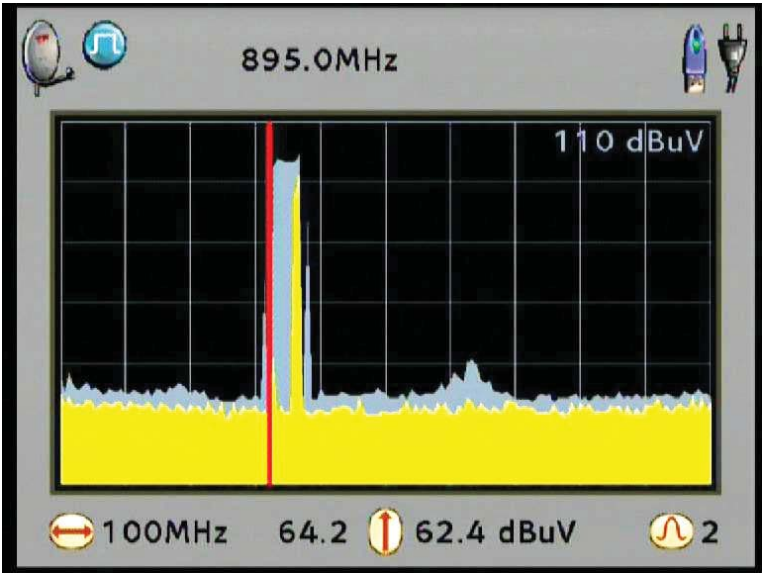
10.6 Use of MDX 600 to match the GSM telephony signals MDX 600

In MDX 600, the satellite band has been extended in its lower part, from 950 MHz up to 863 MHz, which will make this equipment specially indicated to measure signals coming from GSM 900 MHz.

It is not needed to carry out any special adjustment to watch these frequencies (between 863 and 950MHz). You can also do it using the numerical keyboard (pressing the key "123/ABC" and then introducing the frequency with the numeric keys at front panel), or directly turning the rotary key in frequency mode, like you would do in any other satellite frequency.

With a simple sweep of the Standard spectrum it is very diffi cult to see the GSM signals, due to they are spread spectrum signals that varies its frequency very fast. With the "Maximums" mode of detection, capturing these signals is possible.

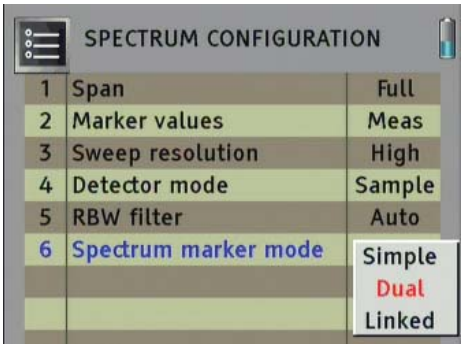
To measure GSM signals in band 900 MHz, enable the mode "Maximums" like is described in the previous chapter, and place the spectrum around 900 MHz.



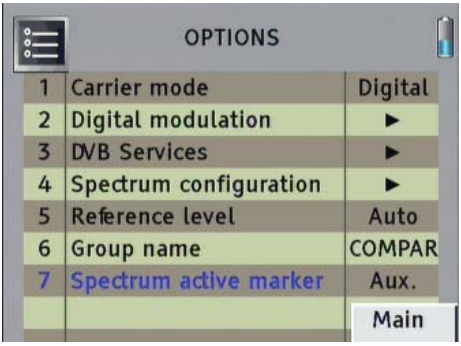
You will see the carriers in real time (in yellow colour) each certain time. The wrapping of these signals will appear in grey colour, which corresponds to the real signal captured with the meter.

10.7 Double marker MDX 600

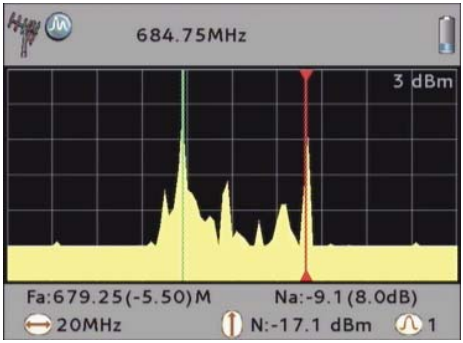
The double marker option allows making measurements comparing between 2 points of the spectrum, calculating automatically the difference of frequencies and level between them. This utility is available only when the spectrum is shown in full screen mode. The selection of the double marker mode is carried out from the submenu “SPECTRUM CONFIGURATION” in the “OPTIONS” menu.



In the “Double” mode, the movement of one of the two markers can be controlled separately. In the mode “Joint” the distance in frequency between both markers is fi xed and it will shift commonly. It could be useful, for instance, for the adjustment of fi lters of one fi xed bandwidth.



The selection of “Active” marker will be done in the “OPTIONS” menu. The selected marker is identifi ed by two little triangles in their edges. The main marker “Main”, used as a reference in the calculations, is in red colour; meanwhile the auxiliary one “Aux” is in green colour.



In this fi gure, the double marker has been used to measure the separation between the 2 carriers (video and audio), and its difference of level. Here, as we are in “Main Marker” ahead the marker “Aux”, and over a lower level peak, the frequency and level measurements are shown in negative value.

11 PROGRAMS

MDX Series meter allows to create programs of the differents signal that user is analyzing and measuring.

One program will store several information as current meter status, frequency, screen mode, spectrum, measurement, image, selected signal mode and supply mode if exists.

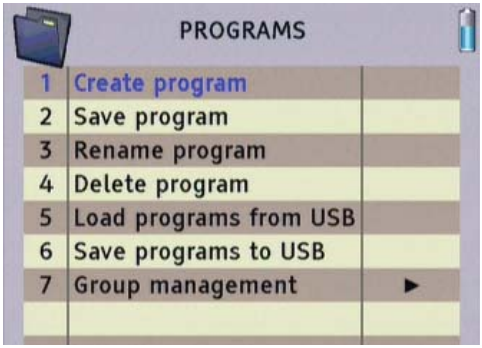
In order to select program as navigation mode, it's important that at least one program it's created before.

11.1 Edit programs

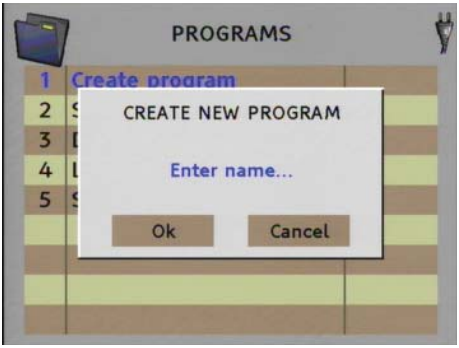
To create a program **MDX Series** meter, select program menu by pressing **"programs"** key. Possible options are hereafter explained:

11.1.1 Create program

This option will allow to create a new program.

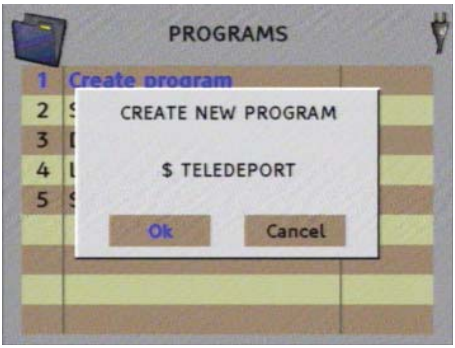


Once this option has been selected, a new OSD window will open with **"Create new program"** and in blue color the text **"Enter name"**. Press click wheel or enter key to begin the edition.



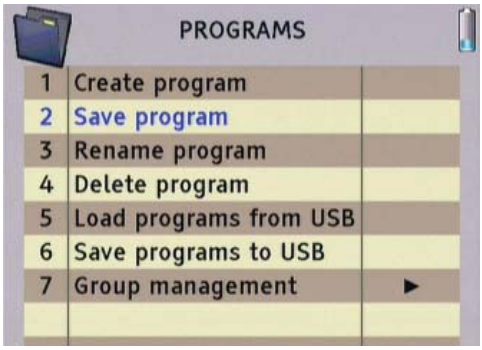
If analog signal is selected, the name of the program should be completely wirtten. To enter letters and numbers, press **"abc/123"** key for alphanumerics. It's possible to delete wrong letters using left arrow key.

If selected signal is digital, the meter will propose the name of the program based on first current program of digital transponder/multiplex. Anyhow, it's possible to change it usging left arrow key.



11.1.2 Save a program

Selecting this option, the program will be stored. The option does not allow to save modifications on stored programs.



11.1.3 Rename a program

This option allows changing the name of an existing program. Turn the wheel and select "**Rename program**" option. A new window with the headline "**Rename program**" will appear.

First press "**Choose name**", this option is just below the line "**Current name**". A new window with the program list will appear. Turn the wheel until you select the wished program.
You will come back to the previous screen and now the name of the program will appear below the line "**Current name**"

Now select the "**Choose name**" option which is just below the line "**New name**". A small new window where you have to write the new name with the alphanumerical keyboard will appear. The ABC/123 key allows changing from writing numbers (numerical entry) or writing letters (alphabetical entry). The field strength meter is configured in alphabetical mode by default.
If there is any mistake, it is possible to remove the last letter by pressing the left arrow from horizontal cursors.

Once the new name is written, press '**Enter**" and turn the wheel in order to select '**OK**' and confirm it to memorize it.

11.1.4 Detele a program

This option allow to delete a stored program. To do it, select the option **"Delete program"** and confirm with **"yes"** option.

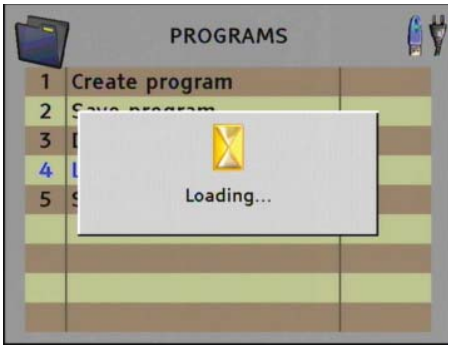
This option will show a program list alphabetically sorted. Select the program and confirm the action.

11.1.5 Load program from USB

This option allows to upload a program from USB device. Before use this option, connect USB device. Otherwise meter will show a message asking for it.

11.1.6 Save program to USB

This option allow to create a security copy of programs on USB device.



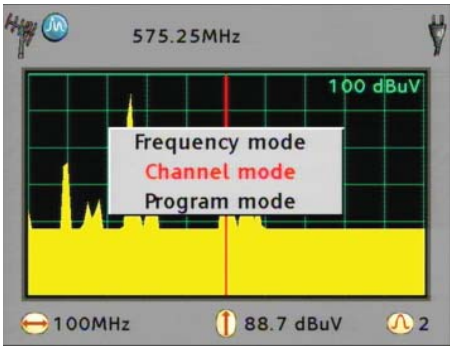
Before to use this option, connect the USB devide. Otherwise the meter will show a message asking for it.

11.1.7 Group management

From this option you can manage all the groups; this menu is the same as “Groups management” in “Datalogger”. Check the “tools”->”Datalogger” section of this user’s guide for further information.

11.1.8 Navigation by program

If program option is selected in navigation mode, it's possible to sweep the band by program instead of frequency or channel.



To navigate through differents program, use click wheel. It's possible to select diretly the program pressing **"abc/123"** key. This option shows the complete current program list.

12 KEY "FAV" FUNCTIONS

The key **"fav"** on main keypad could be configured by the installer in order to select the most frequently used option. In this way, the user could be able to program this key and simplify the quick access to one function among the possible ones.

12.1 Configuration

To setup this key, press the "setup" key and select "system" option on the menu. In this window, select "fav key setup" and this selection will open another window showing the differents option that can be assigned to this key.

Once he desired option has been selected, press **"enter"** to confirm.

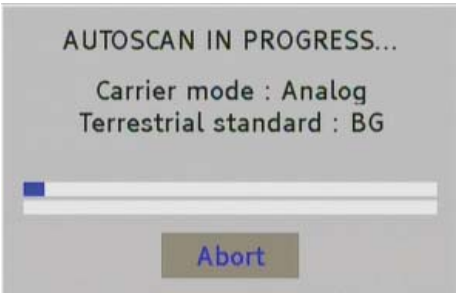
13. AUTOSCAN FUNCTION

This functionality allows tuning the selected carrier automatically, it is, it scans automatically the carrier.

- When a Digital Carrier is detected, automatically it will select the correct parameters for tuning and measuring (as for Terrestrial as well as for Satellite).
- When an Analogue Carrier is detected, it automatically selects the correct modulation standard and the channel will be shown as **"TV"** mode.

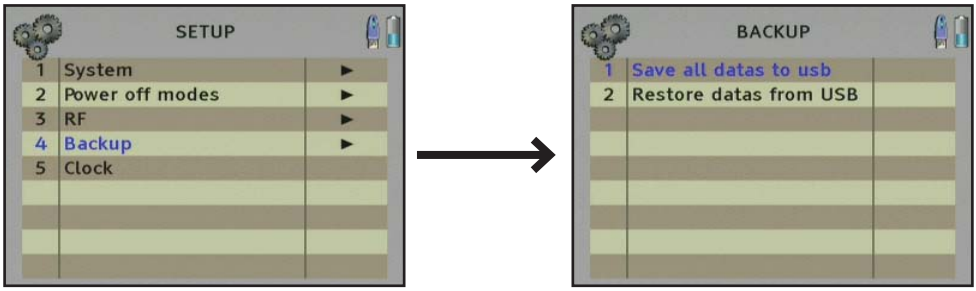
To execute this functionality it is recommended to place the meter in **"spectrum"** mode, in order to be able to watch the different carriers.

Navigate through the different carriers using the navigation key, or introducing directly the frequency. Once you are placed on the analogue signal carrier or at the centre of the digital channel, please push the blue key **"autoscan"**. At that moment the meter will test different configurations up to being able to tune correctly the scanned channel.



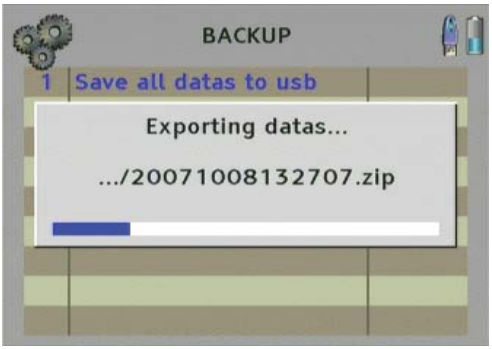
14. SECURITY COPY

This option allows configuring the following options through the configuration menu:



14.1. COPY ALL TO USB

Once this option is selected, a dialog box will appear showing the name of the file (in .zip format) with which will be stored into the USB device. The file name has the format /YEAR/MONTH/DAY/HOUR/MINUES/SECONDS.

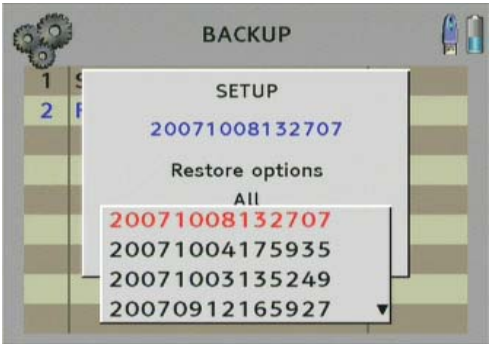


Note: if the .zip file is decompressed, the different files will be classified in different folders depending on the type of file (extension). In this manner, the security copy is organized on Programs, Datalogger, Satellites or Autoscan.

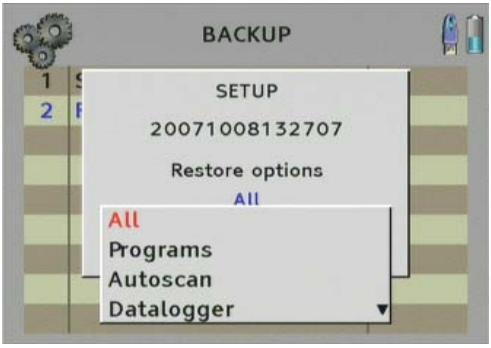
14.2. RESTORE COPY FROM USB

This option allows restoring the meter. There are different options for restoring that we can select through this option (All, Programs, Autoscan, Satellites, and Datalogger). The dialog box of configuration appears for selecting the name of the backup file we want to restore as well as the previous options of restoring:

Pushing on the backup, a dialog box opens with the list of available files to be restored:



Push on the name to select the file that you want to restore. Then push on the option “All” to see the available options that you want to restore.



- Restore all: It imports all the files from the backup. If any file from the USB has the same name that another file from the receiver, it will be replaced by the one from the USB.

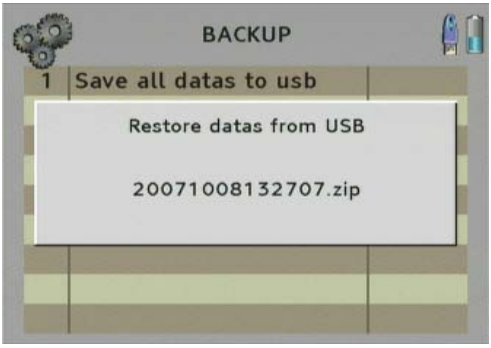
- Restore Programs: It restores the default program list, from the backup. If any program from the USB has the same name that another program from the receiver, it will be replaced by the one from the USB.

- Restore Autoscan: It imports the tuning configurations of the Autoscan. If any file from the USB has the same name that another file from the receiver, it will be replaced by the one from the USB.

- Restore Satellites: It updates the satellite list for the satellite searcher. If any program from the USB has the same name that another program from the receiver, it will be replaced by the one from the USB.

- Restore Datalogger: It imports the Dataloguer options. If any file from the USB has the same name that another file from the receiver, it will be replaced by the one from the USB.

Push “Yes” for restoring.



15. CLOCK ADJUSTMENTS

In this menu you can adjust the time of the receiver. In order to access to this menu, pres key 5 "**Setup**" and select "**Clock**".

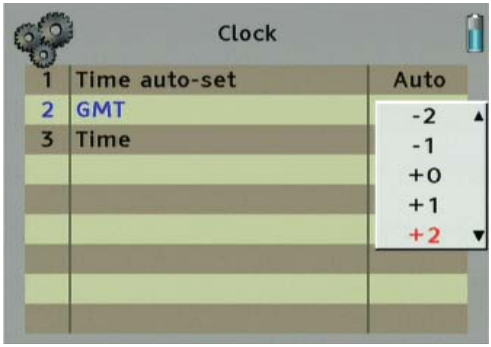
15.1 Time auto-set

In this option you can select the clock in two modes:

- Auto: The field strength meter will adjust the time of the clock when it tunes any digital channel and gets this information.
- Manual: It shows the time that you configure by hand on the section "Time".

15.2 GMT

Select the different time according to Greenwich time in your local time.



15.3 Time

Selecting this option, a new window that allows introducing by hand the time and date will appear.

In order to move through all the values (day / month /year / hours / minutes), use the horizontal cursors or turn the wheel.
In order to modify a value, place yourself over it, press the wheel and introduce the value by the means of the numerical keyboard or turning the wheel. Once it is modified, press again over the wheel to save it.
Once date and time are introduced, turn the wheel until selecting "**OK**" to confirm the changes.

16. TOOLS

In order to access to the tools, press key 8 "**tool**".
A menu with the following tools will appear:

- Datalogger
- Satellite finder
- Band Scan
- DVB T
- TS recording MDX 600
- Transmodulators Programming

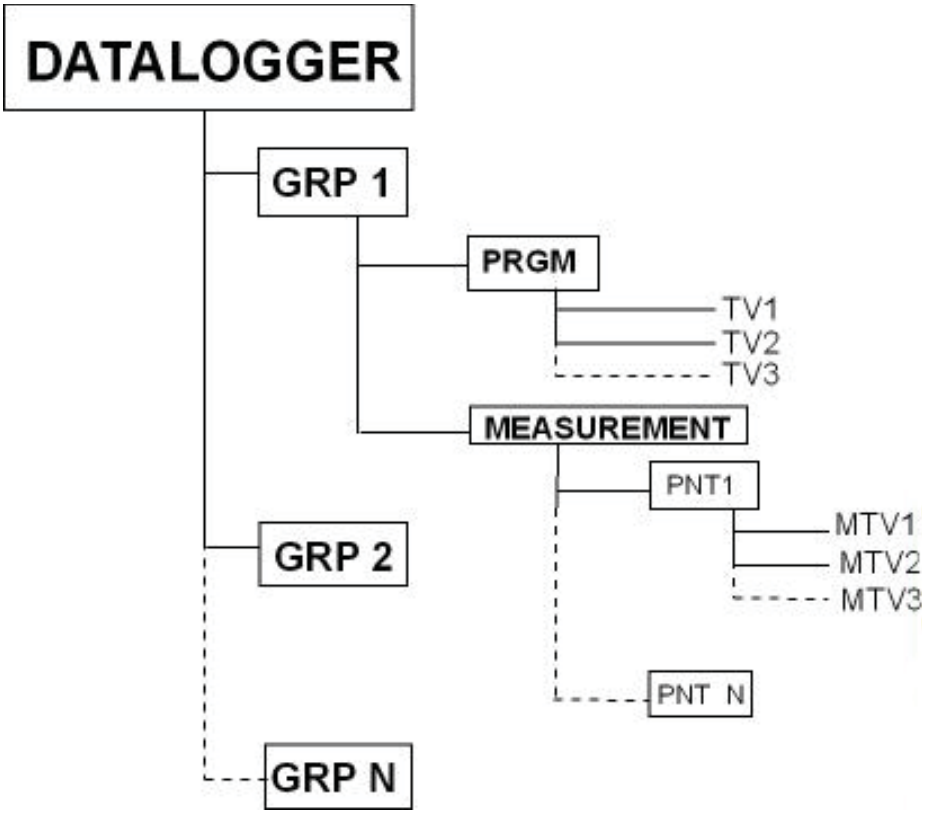
16.1. DATALOGGER

The Data Logger or data acquire program will allow you to convert your Field Strength Meter MDX Series in a powerful system to acquire, store and processing data.

Data Logger allows the creation of groups which contain the programs (signals to measure) as well as the measures related to these programs. It also allows the viewing of the measurements (in the same Meter) and exporting the measurements, to be able to read them later, through the Data Logger software in the Computer.

Data Structure in the Field Meter:

The base structure of the Data Logger is the Group of Measures. It will contain the programs which will be used to carry the measures out as well as the stored measures.



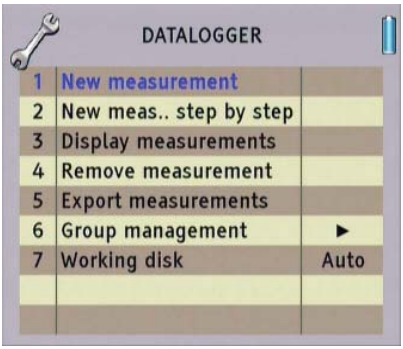
To use the data logger it is needed previously to create the programs (see chapter “Programs”). Once the programs are created, we will group them to begin to use the data logger.

To access to Data Logger, push the **“tools”** button, and then go to **“Data Logger”** option.

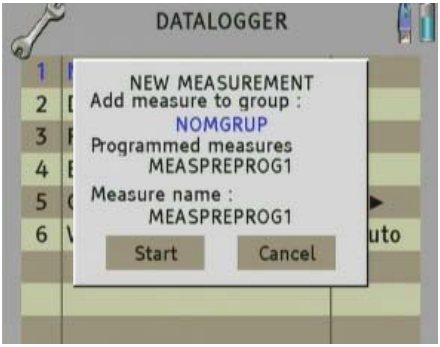
The data logger disposes of the following options:

16.1.1. NEW MEASUREMENT

This option allows carrying out the measurements of a concrete group.

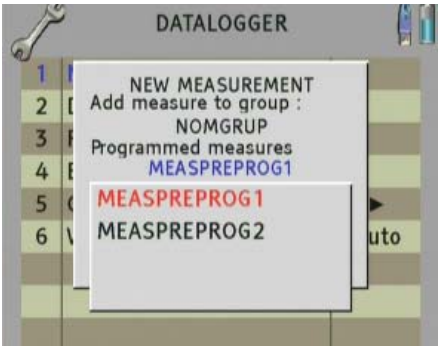


Once it is selected, a dialog box will appear with the text **"New measurement"**. In the field **"Add measurement to the group"** select the name of the group where you want to store the measurement.



A pre-programmed measurement point is exactly the same to a point of measurement, but it doesn't have any measurement. The advantage is that you will have the name of the measurement point without the need of introducing it into the meter. For creating these pre-programmed measurement points, it is recommended the complete version of Datalogger, which allows creating groups, programs and measurements as well as creating reports.

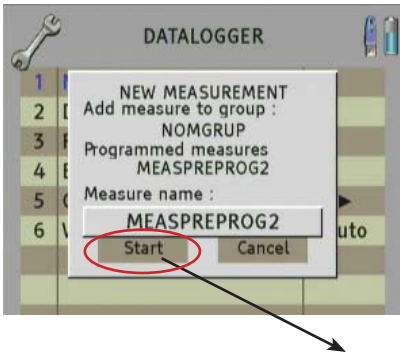
Push on the blue text of the field "Pre-Programmed measures" and the list for selecting the name of the folder where the measurement configurations will be stored will appears. (Only in case of creating the folder into the USB in the before specified route).

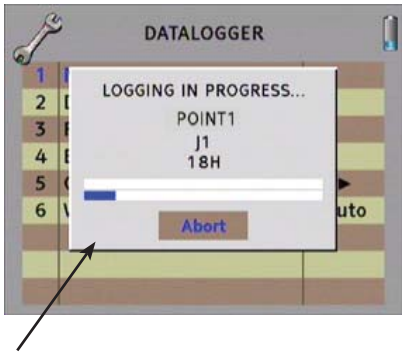


Push “enter” for selecting the name of the folder where all the measurement configurations will be stored.

Note: The field “Pre-programmed measures” can be deleted if you do not want to store the measurements into the USB device. In this case the new measurement will be edited in the field “Name of measure” directly.

Finally select the name of the measurement to carry out in the field “Name of measurement”. Push on the blue text to edit the name and push “enter”.





Push **“Start”** to begin with the measurements.

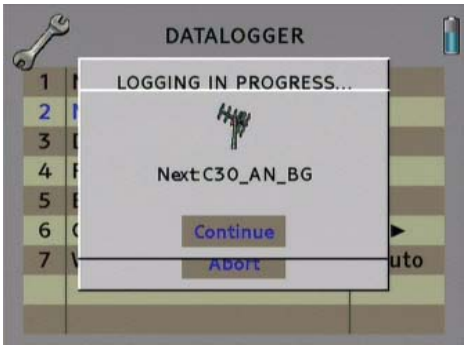
A dialog box will be opened, where you will be able to see the progress of the different programmed measurements that are part of the group. These measurements are stored in the file named previously.

When the measurements are finished, the window of measurements is automatically displayed. In case you change the band, the icon of the band is changed, if you programme to make the pauses between bands or to pause passing to FM.

16.1.2. NEW MEASUREMENT STEP BY STEP

This option will allow making the measures of a certain group, stopping at the program while waiting for the confirmation in order to start measuring.

It works the same as explained in the previous point, but before every program to be measured, the field strength meter remains waiting for your confirmation showing you the following screen:

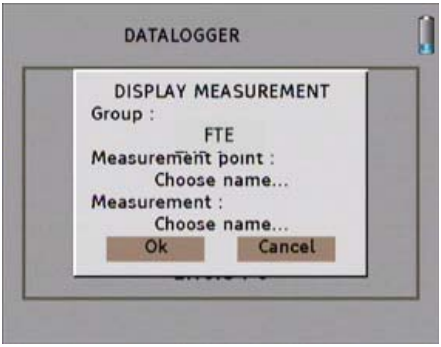


Press the wheel in order to start the measurement each time that the field strength meter requests it, when it is finished, it will show you the measures on the screen.

16.1.3. WATCHING THE MEASURES

This option allows us to watch the measures which have been carried out with the **"New measures"** option.

Once selected, a dialog box will be displayed with the text **"Display measurement"**, **"group"** below and in blue colour the name of the group where we want to display the measure. We will also have the following fields: **"Measurement Point"**, where we will select the name with which the measurement has been stored, just in case that more than one measure has been taken with the same name. In the field **"Measurement"** we will select the program that we want to know about and to display the measure.



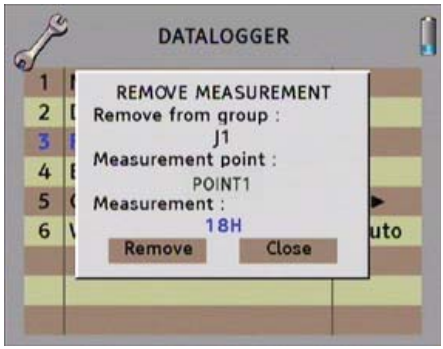
Push **"Yes"** to show. Pushing over the rotary key we come back to the previous menu where we can select different measures as well as show them.

Turning the rotary key to right side we can move from one measure to another one without exiting to the previous menu.

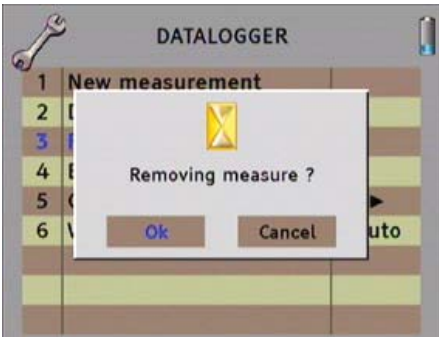
16.1.4. DELETE MEASURES

This option allows deleting the file with all the measures which have been carried out in a specific group.

Once selected, a dialog box will be displayed with the text **"Delete measure"**, then **"Delete from group"** where we will introduce the name of the group where the measure has been taken, and **"Measurement Point"** where we will place the name of the file with which the measure has been stored. Finally, in the **"Measurement"** field, you should select the program where it has been measured.



Push **"Delete"** and a confirmation dialog box will be displayed.

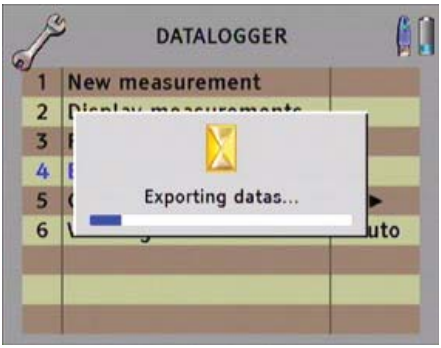


Push **"Yes"** to delete completely the measure and to continue deleting. To exit from the application, push **"Close".**

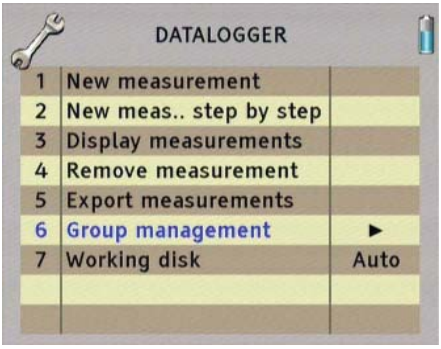
16.1.5. EXPORT MEASURES

This option allows copying the data stored in the external USB 2.0 storage device.

Once this option has been selected, the current group data (we are working with) will be copied directly to the device.



16.1.6. GROUP MANAGEMENT



16.1.6.1. CREATING A GROUP

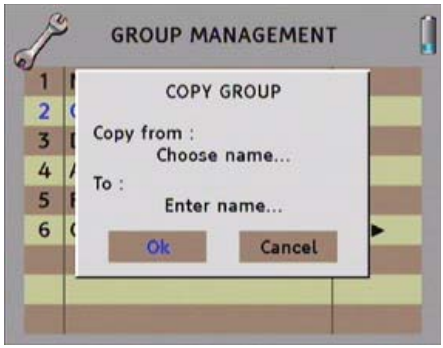
This option allows creating a new group.

Once selected, a dialog box with the text **"Create a new group"** will be displayed, and in blue colour the text **"Write the name"**. Push the rotating key or the **"enter"** key to begin the edition.

To name the group, please introduce it with the alphanumeric keys of the keyboard.
In case of error, it is possible to delete the last setter by pressing the left arrow of the horizontal cursors. Once the name has been written, please push **enter** and turn the rotating key to right to select "Yes" and confirm to store it.

16.1.6.2. COPY A GROUP

This option allows copying the information from one group to another one.



Once selected the option **"Copy Group"**, a dialog box is displayed with the text **"Copy from"** and in blue colour the text **"Write the name"**. Push the rotating key or the **enter** key to select the group you select to copy the information from (it only will be copied the group configuration and the contained programs. The measurements carried out in the origin group will not be copied).

Once selected, please push **enter** and turn the rotating key to right to select **"Yes"** and confirm.

16.1.6.3. DELETE A GROUP

This option allows deleting a group.

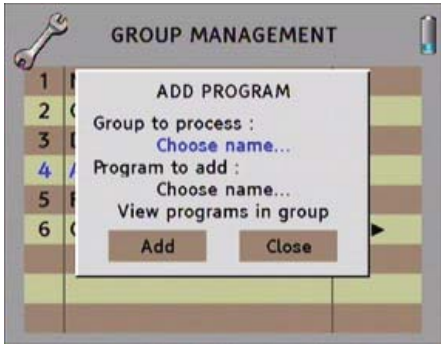
Once the option is selected, a dialog box will appear with the text **"Delete Group"** and in blue colour the text **"Select name"**. Press the rotating key or the **enter** button to select the group you want to delete.

Once the group is selected, please push **enter** button and turn the rotating key to left to select **"Yes"** and confirm to delete it. A dialog box will appear in order to confirm the deleting. Push **"Yes"**.

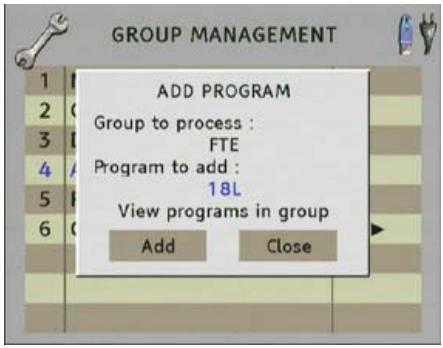
16.1.6.4. ADD A PROGRAM

With this option we will configure our groups with the list of programs which will compose the group.

Once the option is selected, a dialog box will appear with the text **"Add program"**. Where we can see the message **"Process Group"**, we should introduce the name of the group where we want to add a new program. Once selected, please push **"enter"**.



In the following message: **"Add program"** we will select the name of the program that we want to add to the group, which has been previously selected. (Remember that before selecting a group or program, it should be previously created).



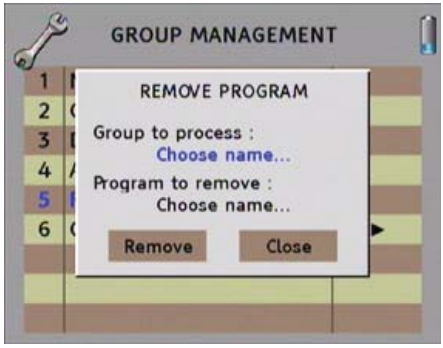
In the dialog box there is a last option **"Watch programs of the group"**. In this mode, we can have a control about the programs that we want to add to the group. In case of duplicated programs, an error message is displayed in order to inform that the current program could not be added.

Pressing **"Add"** the program will be inserted into the group we have selected, and the dialog box will keep opened in order to continue adding new programs. To finish the application, please push **"Close"**.

16.1.6.5. DELETE A PROGRAM

This option will allow us to delete a program from a specific group.

Once the option is selected, a dialog box will appear with the text **"Delete program"**. Where we can see the message **"Process group"** we should introduce the name of the group where the program we want to delete is placed. Once it is selected, we must push **"enter"**.



In the following message: **"Delete group"**, please select the name of the program that you want to delete. Pushing the **"Delete"** button an additional dialog box will be displayed to confirm the deleting of the program.

Push **"Yes"**. To finish, please push **"Close"** button.

16.1.6.6. LOAD GROUP FROM USB

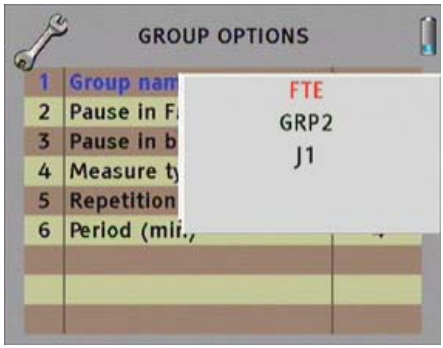
This option allows importing from a USB memory to the field strength meter, except for the measurements made.
Before using this option you must connect a USB memory.

16.1.6.7. GROUP OPTIONS

This option allow us to configure all the following options:

16.1.6.7.1.NAME OF THE GROUP

Once this option is selected, a dialog box will appear with the list of groups created. This option allows selecting the group we want to work with, simply pushing over it.



16.1.6.7.2. PAUSE IN FM BAND

This option allows changing the connector we are using for the one of the FM connection where we are carrying measures out, due to the measurement in FM in several times could be made in another connector.

Meanwhile we are making the measure of the group, if the Meter detects a FM program, it would pause the measurement and it would wait up to the confirmation again once the cable has been changed. Once the FM measure is finished and you are in a different measure, the Meter will come back to pause the measurement and wait to the confirmation to continue.

Please, push the rotating key to watch the options and to choose “On” / “Off” according to the kind of measure we are going to make.

16.1.6.7.3. PAUSE IN BAND SWITCHING

This option allows changing the connector we are using for another one from another band, as Satellite, Terrestrial, etc. The philosophy is the same as in point 14.5.6.2.

16.1.6.7.4. KIND OF MEASURE

This option allows selecting to make a complete measure or a Basic measure.

Complete: Depending on the memory where the measures are stored, you can find:

- If it is internal memory:
  - **Analogue measure:** you can store measures, spectrum and line of synchronism (the FM signals do not store the line of synchronism).
  - **Digital measure:** the measures and the spectrum are stored.

- If it is external USB memory:
  - It would be the same case than in the **internal memory**, but in case of TV signal, the picture would be stored as well.

Basic: Only the value of the measures will be stored, independently of the kind of storage memory device.

16.1.6.6.5. REPEATING

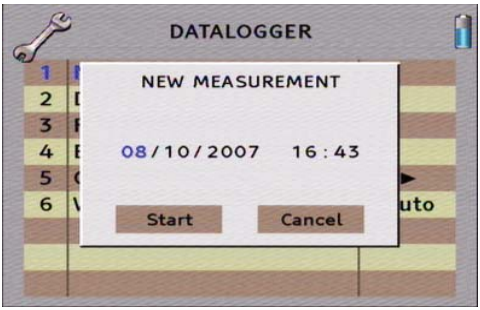
With this option we can select between 1 to 255 values, it is the number of times we want the measure is repeated in order to get more accuracy in the final calculation.

16.1.6.6.6. PERIOD

It is the repeating time of the measurement, by default one and it is expressed in minutes. Every time, the measure will be repeated. If we push on the rotating key we can write a value between 1 and 256.

16.1.6.6.7. TEMPORIZE MEASUREMENTS

This option allows configuring the time to programme a measurement at one specific time.
In case this option is enabled, the option for configuring the time when the new measurement will be carried out will be displayed.



16.1.6.6.8. RECORD PULSE RESPONSE

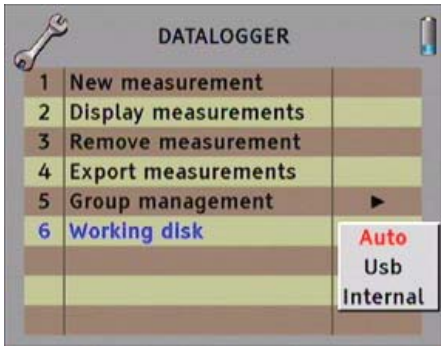
This option allows capturing the impulsive answer in the moment of making the measurement. It order to activate it, this option must be "**On**".

16.1.7. DISK OF WORKING

With this option we have the possibility of choosing if we want to work into the internal disk or in the external storage device USB 2.0.

Once the option is selected, a dialog box will appear and we will be able to choose among three different options.

- **Auto:** The Meter decides where the data will be stored. If there is external memory connected, the Meter will store the data in it. If not, it will use the internal memory.
- **USB: T**he Meter always will try to use the external memory connected to the USB port. If this memory has not been connected an error message will be shown, reminding that there was an error storing the data and it will be not stored.
- **Internal:** Always the internal memory is used to store the data.

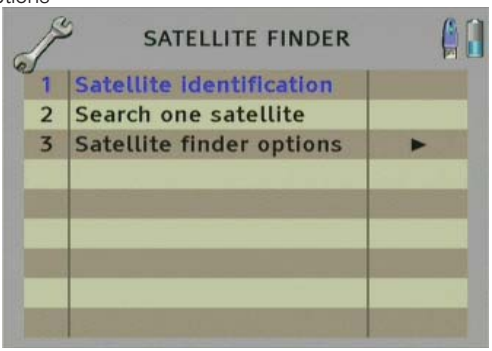


NOTE: If the kind of measure of a group is complete and it is selected USB as storage device, the Meter will be able to store a capture of the Picture in JPEG format to be viewed later in the Data Logger software in the computer.

16.2. SATELLITE FINDER

This tool allows carrying out the following actions:

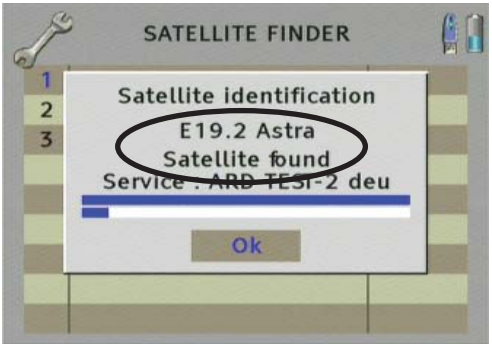
1) Identify the satellite
2) Search a satellite
3) Configuration of options



16.2.1. IDENTIFY THE SATELLITE

This option searches based in a list of satellites that the meter has configured and it will identify the satellite that is being tuned. It informs if the satellite is or not locked.

Once the satellite is identified, a message confirming that the satellite has been identified will be displayed.



16.2.2 SEARCHING A SATELLITE

This option allows searching a specific satellite placed in the list of satellites the meter has, and to know if it is locked or not. Selecting this option, the following dialog box will appear, in order to select the satellite you want to search.

Depending on if the satellite is locked or not, the following configurations will be shown, indicating: the power level, the DiSEqC switch status as well as the RF input voltage.

Not locked

Locked

16.2.3. OPTIONS

Into this menu, you can configure the following options:

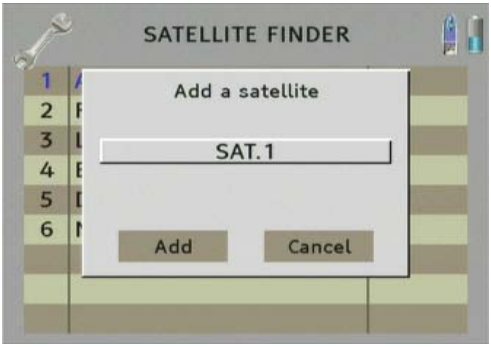
1) Add a satellite.
2) Delete a satellite.
3) Import Satellites.
4) Export satellites.
5) Show the satellites.
6) New parameters Satellite

16.2.3.1 ADD A NEW SATELLITE

This option allows introducing a new satellite into the list. The following dialog box will be displayed, where a new name for the satellite must be introduced.

Note: In order to it works, the meter should be locked to a digital satellite signal previously.

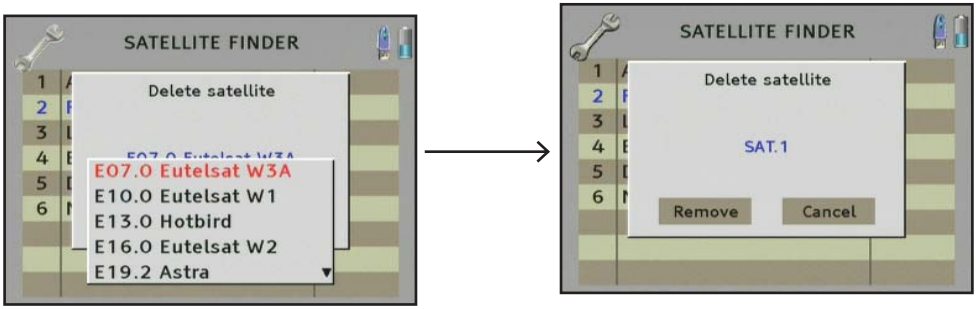
Push on the blue text “Introduce name” to edit the field:



Once the field is edited, push the button “Add”.

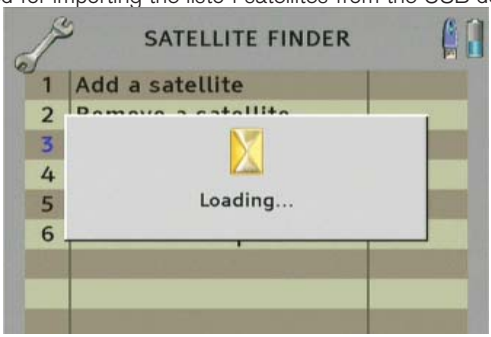
16.2.3.2. DELETE SATELLITES

This option allow deleting a satellite previously introduced into the list. Pushing on the blue text, the list of satellites will appear. Select which satellite you want to delete.
Push the “Delete” button and then the key “Yes” in the next dialog box for confirming the deleting of the satellite.



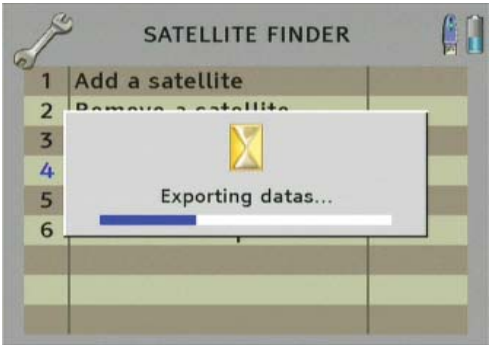
16.2.3.3. IMPORT SATELLITES

This option allows importing one satellite list from a USB device. Pushing over this option, the selected file will be loaded for importing the listo f satellites from the USB device.



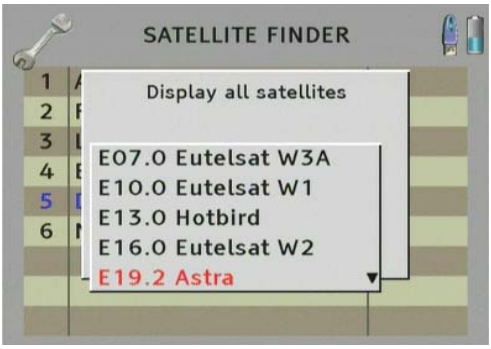
16.2.3.4. EXPORT SATELLITES

This option allows saving the configuration of the satellite list into a USB device. Pushing on this option, the last configuration will be saved on this file.



16.2.3.5. SHOW SATELITES

This option allows showing the list of satellites. Pushing on the blue text, a dialog box will appear with the list of satellites.

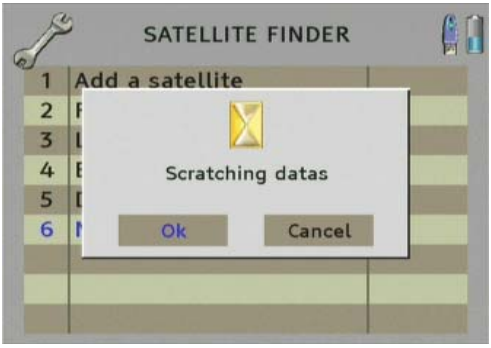


16.2.3.6. NEW PARAMETERS SATELLITE

This option allows upgrading the parameters from one specific satellite and overwriting them on the previous data.

Note: The meter must be locked to a digital satellite signal previously in order to make this option work.

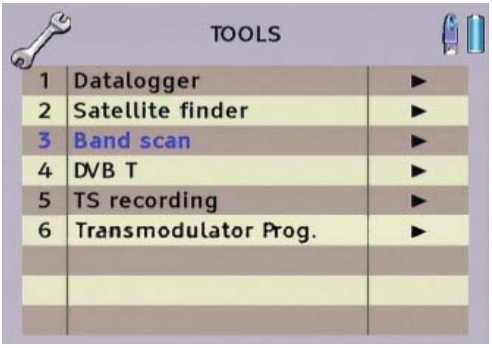
Select the satellite to upgrade.



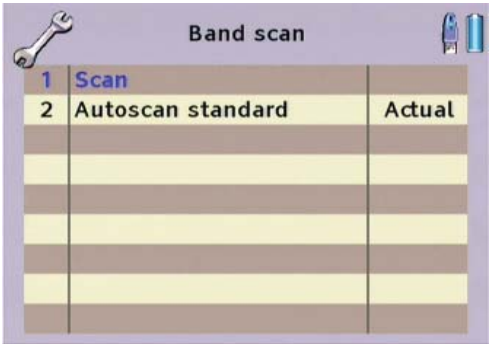
Confirm the upgrading of the data.

16.3. BAND SCAN

It allows us to carry out a complete sweep of the Terrestrial Band and to store the detected TV programs in the band, into a group of measurements.



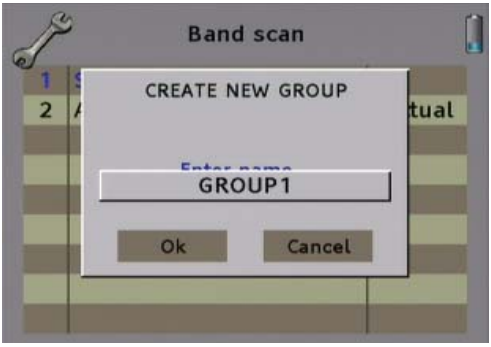
In the Terrestrial Band, go to the tool "Band Scan". You will see the following window:



In the option "2. Autoscan Standard" you can select between "Actual" or "All".

- If you select "Actual", the sweep of the entire band will be carried out only with the selected standard in the RF configuration.

- If you select "All", the sweep in the Terrestrial Band is carried out checking out all the standards in the Terrestrial Band. This process will be slower than selecting the Current Standard.
Once the standard is defined, select "1. Scan" and press Ok.



The meter asks about the name of the new group. Once it is introduced, the Band Scan will begin.

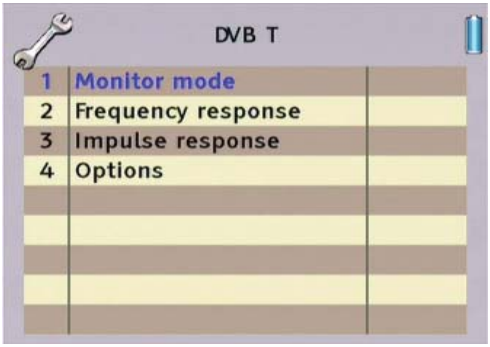
16.4. DVB-T TOOLS

Before using these tooling you have to tune a digital terrestrial channel.

These tools are the frequency response and the impulse response, and can be used to monitor the DVB-T. These two tools are related, and allow to see similar phenomenon but with slightly different approaches.

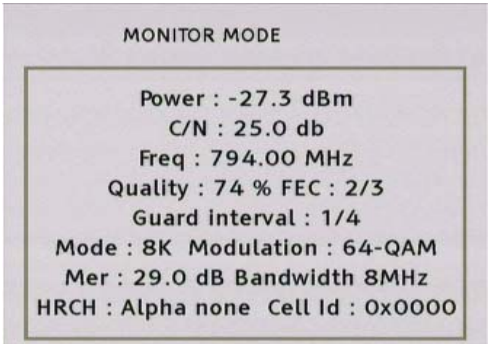
The impulse response function allows monitoring the carrier power distribution during a period of time, while the frequency response function allows monitoring the digital C/N of each one of the DVB-T carriers.

In order to access to the tools of DVB-T, press key 8 “tool” and select “DVB T” option.
A new menu with the following tools will appear:



16.4.1 Monitor mode

This menu option is a screen of measures. It shows some additional measures of the digital terrestrial television signal.



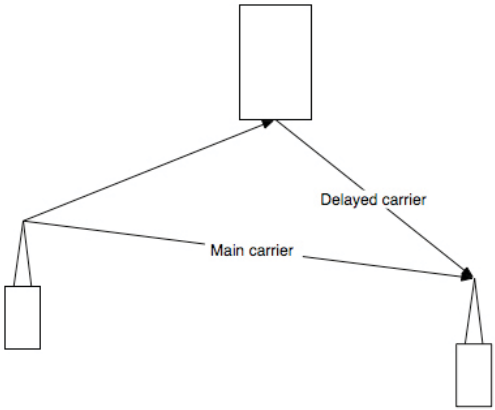
The additional measures are:

Guard interval
Mode: bearer number
HRCH: Hierarchy
Cell Id: Parameter about operators.

16.4.2. Impulse response

The impulse response function will show the power distribution of the carrier during the time it is being processed by the receiver.

In theoretical conditions, all the power should arrive at the same time to the receiver. In the real world, the antenna will pick the carrier, but this same carrier can be reflected by nearby objects (mountains, buildings).



The received signal is the sum of the main carrier plus the delayed carrier. These reflected signals arrive with a time delay because they travel through a longer distance than the direct signal before getting to the destination. The DVB-T modulation includes a "Guard Interval" that allows all the delayed carriers arriving during this interval not disturbing too much the main carrier (always in reasonable limits fixed for the different transmission systems).

The following screenshot shows a near perfect DVB-T carrier, where most of the power is concentrated in a single point, meaning that most of the power is arriving at the same time.

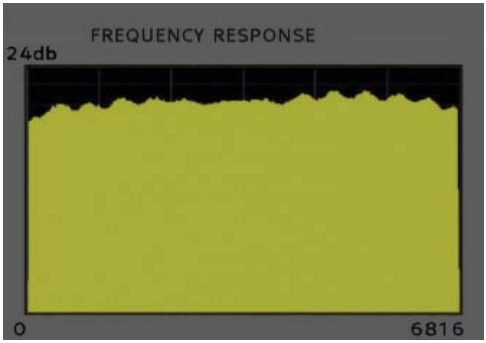
The following screenshot shows a carrier with a very big “echo” received around 2us later than the original carrier.

Even if the delayed carrier has almost the same power than the original one, the image can be decoded without problems.

16.4.3. Frequency response

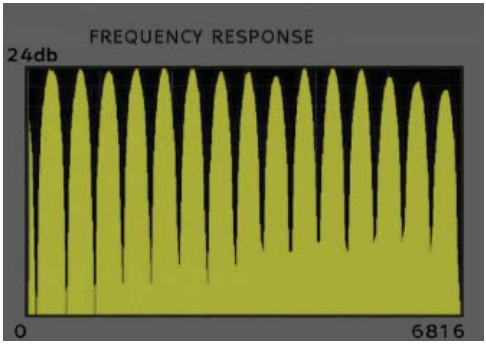
The frequency response function allows monitoring the digital C/N levels for each DVB-T carrier. In fact the echoes can also be seen with the frequency response, but the interpretation is different.

The following screenshot shows the frequency response for a near perfect DVB-T carrier, where all the carriers have a similar level, remaining almost hidden.



The frequency response is almost flat for all the carriers (6816 carriers for an 8k DVB-T) in the above screenshot. This means that the digital C/N for all the carriers is very good.

The following screenshot shows the frequency response for a carrier with a delayed signal of 2us and with similar power than the main carrier.



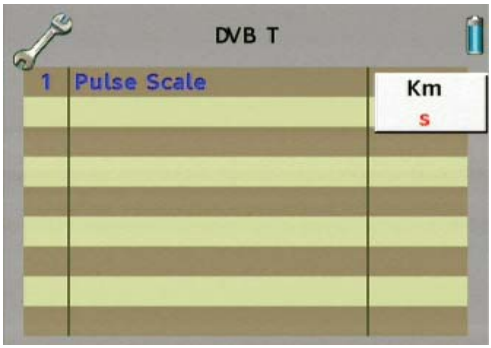
The above screenshot shows the typical behavior of the frequency response when a clear echo is present.

16.4.4. Options

When you get in this menu you will be able to configure the following options:

16.4.4.1. Pulse Scale

Select the units you want to represent the pulse in the graphic. It can be represented by time (**seconds**) or distance (**Km**).

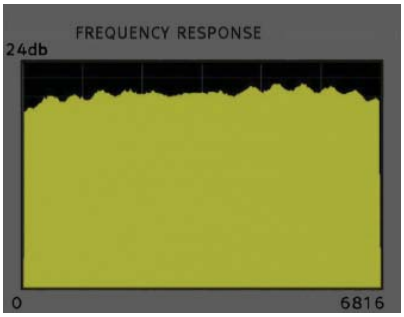


16.4.5. Relationship between frequency response and impulse response

The following examples will show how the same signals are viewed with the frequency response and impulse response functions.

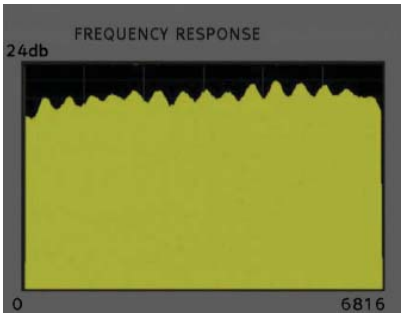
DVB-T signal at the output of a modulator

Impulsive response



Frequency response

DVB-T signal with an "echo" at 2us delay. The delayed carrier power is much lower than the main carrier

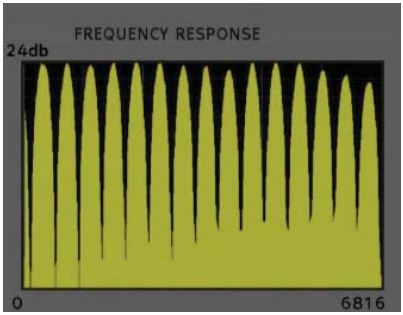


Impulsive response

Frequency response

In the above example the "reflected" (delayed) carrier is around 24dB lower than the original carrier. The frequency response is still very good, but the ripple becomes visible.

DVB-T signal with an "echo" delayed 2us. The two carriers have almost the same power level.



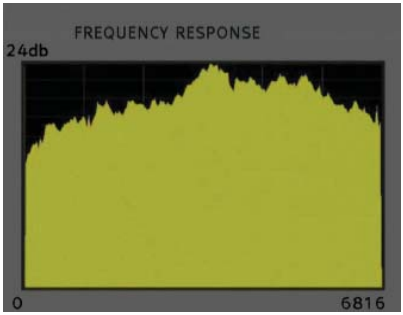
Impulsive response

Frequency response

In the above example the delayed carrier is only 2dB lower than the original carrier. The frequency response shows a very big ripple, but the overall digital C/N is still good.

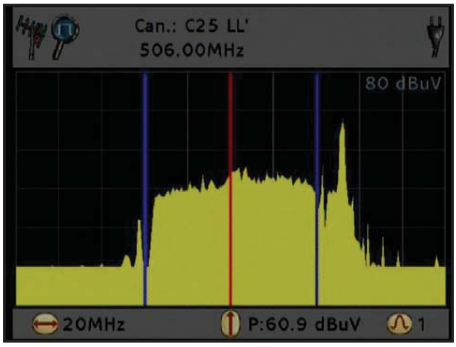
Good quality DVB-T signal from the air

Impulsive response



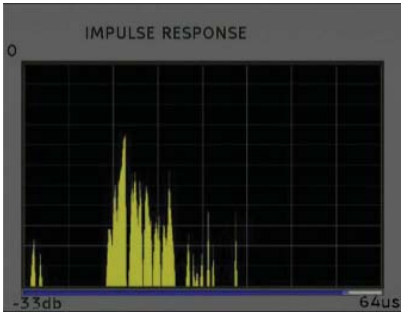
Frequency response

In the above example the carrier is a little more distorted than a signal coming directly from a modulator, as it has traveled in open air. The distortion is more visible in the frequency response mode than in the impulse response mode.

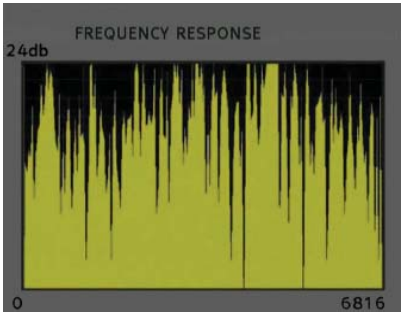


The above screenshot shows the same signal, but in spectrum mode. It can clearly be seen that the frequency response and the spectrum is very similar, but the frequency response function allows a much better resolution of the DVB-T carrier.

Bad quality DVB-T signal from the air



Impulsive response



Frequency response

In the above example the carrier has traveled a long distance, and is extremely distorted. The carrier power is spread around a long time (around 40us). Even with this level of distortion, the signal is usable (quality around 30%).

16.4.6. When to use the impulse response mode or the frequency response

The impulse response function is very useful when pointing antennas, as it will be possible to choose the antenna direction in which the carrier echoes are the lowest possible.

The Frequency response function will help more to monitor the global signal quality (it is more visual than simple C/N measurement), or to adjust narrow band filters.

Note: If the echoes fall out of the guard interval, the signal will be almost impossible to decode. This means that it will be also very difficult to lock, so probably the meter will not be able to analyze it.

16.4.7. Guard interval duration

The guard interval duration depends on the modulation type (2K, 8K), the signal bandwidth (6,7 or 8 Mhz) and obviously the guard interval parameter itself. The following tables show the different guard interval durations depending on all the above parameters

For 8Mhz carriers

Mode	**8K (6817 portadoras)**				**2K (1705 portadoras)**			
GI	1/4	1/8	1/16	1/32	1/4	1/8	1/16	1/32
Duration	224us	112us	56us	28us	56us	28us	14us	7us

For 7 MHz carriers

Mode	**8K (6817 portadoras)**				**2K (1705 portadoras)**			
GI	1/4	1/8	1/16	1/32	1/4	1/8	1/16	1/32
Duration	256us	128us	64us	32us	64us	32us	16us	8us

For 6 MHz carriers

Mode	**8K (6817 portadoras)**				**2K (1705 portadoras)**			
GI	1/4	1/8	1/16	1/32	1/4	1/8	1/16	1/32
Duration	298,7us	149,3us	74,7us	37,3us	74,7us	37,3us	18,7us	9,3us

16.4.8. ¿How to know the Guard Interval of a signal if we have used "AUTO" to tune the signal?

In the MDX you cad find this data through the tool of functions for DVB-T in the monitor section. On the screen all the parameters of the signal can be seen.

Knowing which GI is using the received signal, the Transmission Mode and the Bandwidth, you can check if the "echoes" or reflected signals are close or not to disturb the main signal.

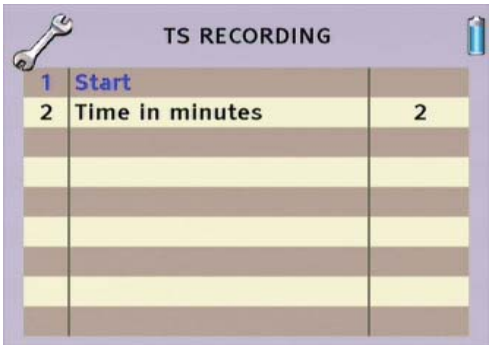
For example: in a transmission of 8K with GI of ¼ and Bandwidth of 8MHz, we have a IG duration of 224 us. During this time, the signal is "protected" against the received "echoes", although obviously, the "echoes" will affect to the quality of the signal.

16.5. TS RECORDING MDX 600

You can make a capture of a Transport Stream of a video signal if you have an USB device connected. The length can be configured from 1 minute to 255 minutes.

In order to access to this tool, press the 8 key "**tool**" and select the "TS Capture" option.

In the TS Capture option, the next options will appear:



16.5.1. Start

Selecting this option the Transport Stream capture will start.

You must have an USD 2.0 device connected in order to be able to store the capture.

The capture will finish automatically when the time indicated in the field "Time in minutes" has passed

16.5.2. Time in minutes

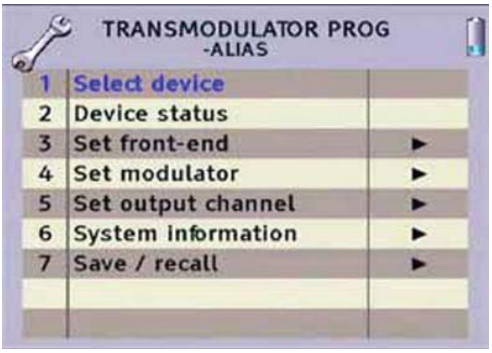
In this option you must select the time that the Transport Stream video capture last in minutes.

Select a value between 1 and 255 minutes.

16.6. TRANSMODULATORS PROGRAMMING

From this tool it is possible to program the transmodulators modules of 100 series:
HSCT 100, HS2CT 100, HSTT 100, HS2TT 100, HTTR 100, HCCR 100

From this menu we can configure the modules, visualize the measurements of the treated signals, read the events log and update the firmware, among other functions



In order to program the transmodulators we need a DB9 male - RJ-45 cable.

The pins connections are the following:

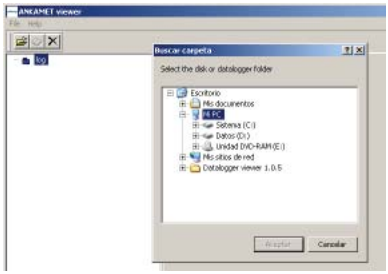
ANNEX I
VIEWER OF ANKAMET

VIEWER OF ANKAMET

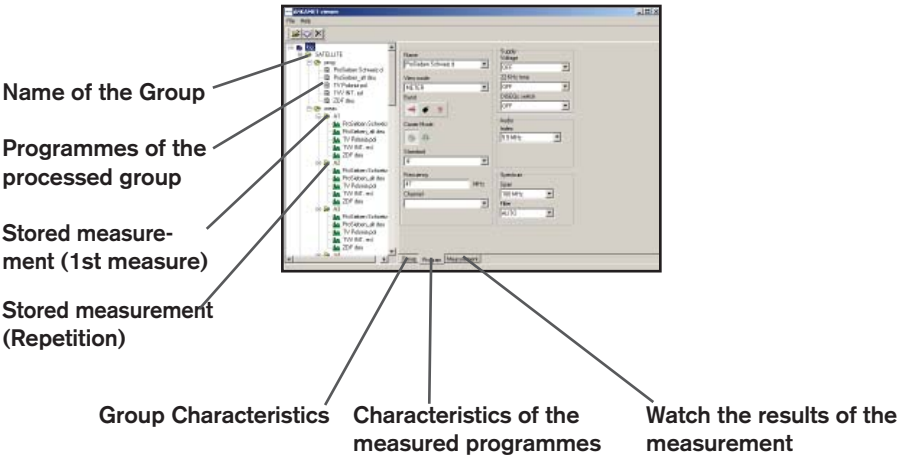
The viewer of ANKAMET shows the measured data into the Test Equipment and it represents them in this programme.

You will be able to import the data and to store them for processing them later.

Click on the **"File"** menu and select the **"Import"** option. A dialog box named **"Search Folder"** will appear. Select then the folder **"log"** (generated by MDX Series when is exporting the data into the USB device), and choose **"OK"**.



As soon as the measurement data are read from USB, they will be exported with the file structure into the Data Logger Viewer.

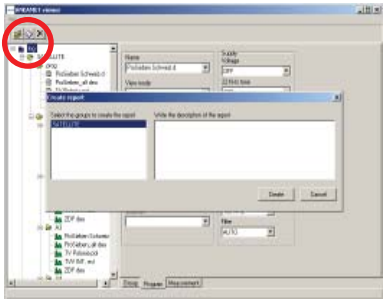


The measured data will be able to be watched and printed out.

For printing select the book symbol button to generate the documents.

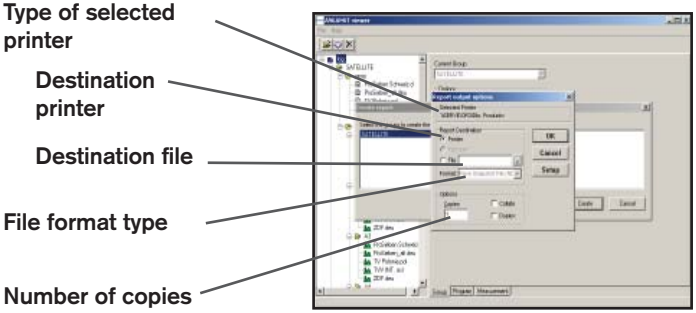
In next window you should select the option **“Group of measurement”** that you want to print out.

The field **“information of the report”** can be filled out as you prefer with the data that describe the content of the group (information that will be shown in the first page of the generated report).



Alter introducing all the data, confirm them with the button “Create”.

In the next window select the output options.



Please, confirm just pressing **OK**.

NOTE: In case of exporting files to PDF format, you should add to the file “.pdf” manually. For example, if the file is called “test”, you should name it “test.pdf”
